IMPORTANT SAFETY NOTICE

There are special components used in this equipment which are important for safety. These parts are marked by  in the Schematic Diagrams, Circuit Board Diagrams, Exploded Views and Replacement Parts List. It is essential that these critical parts should be replaced with manufacturer's specified parts to prevent shock, fire or other hazards. Do not modify the original design without permission of manufacturer.

1. OPERATION

1.1. Location of Controls

1.1.1. Base Unit

1.1.2. Cordless Handset

1.1.3. Charger

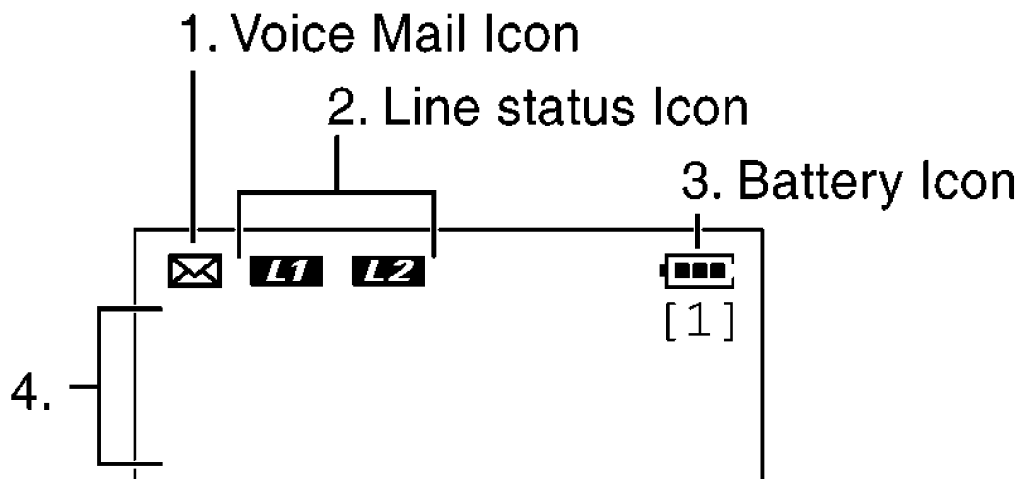

1.2. Displays

1.2.1. Base Unit

1. The handset in-use icon indicates the status of registered cordless handsets. If a cordless handset is in the talk or intercom mode, or listening to messages, the relevant number is displayed.
2. If you turn the Automated Attendant System on, the relevant line icon is displayed.
3. The time and data are displayed on the first line in the standby mode. The display shows the dialed number, call status, programming options and directory items etc. If you subscribe to a Caller ID service, caller information will be displayed.

1.2.2. Cordless Handset

1. The voice mail icon flashes if there is at least one new message in your mailbox. During playback, it will be displayed.
2. The line status icons function as follows.

Off (invisible)	The line is free.
On	The line is being used.
Flashing	A call is on hold. The Automated Attendant System or Answering System is responding to a call.
Flashing quickly	A call is being received.

3. The battery icon indicates the battery strength.
4. The handset number ([1] to [8]) is displayed in the standby mode. The display shows the dialed number, call status, programming options and directory items etc. If you subscribe to a Caller ID service, caller information will be displayed.

1.2.3. Backlit LCD Displays

Both the base unit and cordless handset have a backlit LCD display. The lighted cordless handset display will stay on for about 10 seconds after pressing a button or lifting the handset off the charge.

1.3. INSTALLATION

1.3.1. Installing the Backup Battery in the Base Unit

A rechargeable Ni-Cd battery works as emergency power during a power failure. The fully charged backup battery provides the base unit with a minimum of 20 minutes operation. The battery is charged in the base unit while the AC adaptor is connected. It takes about 10 hours to charge fully.

1. Open the battery cover.

2. Install the backup battery in the battery compartment. Close the

battery cover.

Battery Indicator:

- The BATTERY indicator lights while the battery is being charged.
- During a power failure (or if the AC adaptor is disconnected), the BATTERY indicator shows the battery strength:
Full to Medium: The indicator lights.
Low: The indicator flashes.
No power: The indicator light is off.

BATTERY Indicator

- The battery cannot be overcharged.
- If the backup battery has been discharged during a power failure, the unit will not work. If required, you can connect a standard telephone on the same line.

1.3.2. Connecting the Handset and AC Adaptor

- Use only a Panasonic Handset for the KX-TG2000CB.
- **USE ONLY WITH Panasonic AC ADAPTOR PQLV12Z.**
- The AC adaptor must remain connected at all times. (It is normal for the adaptor to feel warm during use.)
- The BATTERY indicator lights while the AC adaptor is connected with the backup battery installed.
- If your unit is connected to a PBX which does not support Caller ID services, you cannot access those services.

1.3.3. Connecting the Telephone Line Code(s)

Connect the telephone line cord(s) to the base unit

1.3.3.1. To Connect a Two-Line Telephone Jack

1.3.3.2. To Connect Two Single-Line Telephone Jack

1.3.3.3. If You Use the Unit as a Single-Line Telephone Only

- With this connection, you can only use LINE 1.

1.3.4. Adding Another Phone

If the backup battery has been discharged during a power failure, the unit will not work. If required, you can connect a standard telephone on the same line using a T-adaptor.

1.3.5. Connecting the AC Adaptor to the Charger

- **USE ONLY WITH Panasonic AC ADAPTOR KX-TCA1-G.**
- **The AC adaptor must remain connected at all times. (It is normal for the adaptor to feel warm during use.)**

1.3.6. Handset Battery Charge

Place the cordless handset on the charger and charge for about 8 hours before initial use. Make sure the handset faces forward as shown.

- **The CHARGE indicator lights.**
- **If you charge the discharged battery, it will be charged quickly. In that case the handset may feel warm. This is normal.**

1.3.6.1. Handset Battery Strength

You can check the battery strength on the handset display. / The battery strength is shown as in the chart below.

Display prompt	Battery strength
	Fully charged
	Medium
	Low
(flashing)	Needs to be recharged.

1.3.6.2. Recharge

Recharge the battery when:

— “Recharge” is displayed on the handset, / — flashes on the handset display, or
/ — the handset beeps intermittently while it is in use.

- If you **DO NOT** recharge the battery for more than 15 minutes, the display will keep indicating “Recharge” and/or will continue to flash.

1.3.6.3. Handset Battery Information

After your Panasonic Battery is fully charged.

Operation	Approx. battery life
While in use (TALK)	Up to about 8 hours
While not in use (Standby)	Up to about 4 days

- Battery life may be shortened depending on usage conditions and ambient temperature.
- Clean the charge contacts of the handset and the charger with a soft, dry cloth once a month. Clean more often if the unit is subject to grease, dust or high humidity. Otherwise the battery may not charge properly.
- If the battery is fully charged, you do not have to place the handset on the charger until “Recharge” is displayed and/or “” flashes. This will maximize the battery life.
- The battery cannot be overcharged.

1.3.7. Using the Handset Belt Clip

you can hang the cordless handset on your belt or pocket using the belt clip.

To attach the belt clip

To remove the belt clip

1.3.8. Wall Mounting for the Charger

The charger can be wall mounted. / Install screws using the wall template on the right. Connect the AC adaptor. / Mount the charger, then slide it down.

1.4. Programmable Setting

1.4.1. Programming Guidelines **Base Unit** **Handset**

This unit has various programmable functions. Most of them are selected from the function menu on the display.

How to select a function item from the menu

1. Press [**FUNCTION**] while in the standby mode. The main menu is displayed.
2. You can scroll through the menu by pressing ↓ or ↑. Find the desired item and point the arrow to the item by pressing ↓ or ↑.

Base Unit

Ex. "Ringer setting" is at the arrow.

```

Save directory
Date and time
▶ Ringer setting
  
```

3. Press ▶ to select the item.
4. If the selected item has a sub-menu, it will be displayed. Select the sub-menu item by pressing ↓ or ↑, and press ▶.
5. You can then select the desired setting.
 - [**ENTER**] is used to select or save a programming setting.
6. When programming is complete, a confirmation tone sounds. The display will return to the main menu or the sub-menu (if the

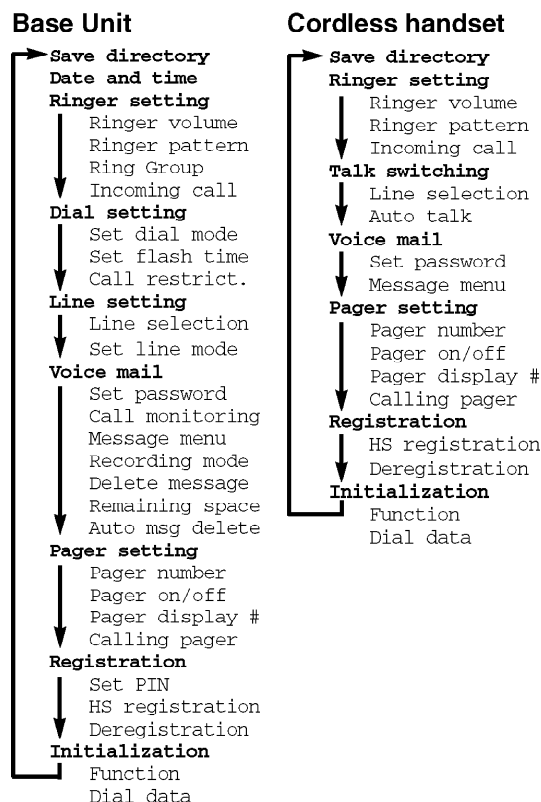

function item is in the sub-menu). You can continue programming other items. To return to the standby mode, press [EXIT] .

Useful information:

- You can go back to the previous display by pressing ◀ except when entering characters or numbers. To return to the main menu from the sub-menu, press ◀.
- You can exit the programming mode any time by pressing [EXIT] .
- If you do not press any buttons for 60 seconds, the unit will return to the standby mode.
- If the unit detects a problem, an error message will be displayed.

1.4.2. Function Menu Table **Base Unit** **Handset**

You can use the following functions to customize your system according to your needs. After pressing [FUNCTION] , the main menu is displayed. Most items in the main menu have a sub-menu. The sub-menu is shown after selecting the item in the main menu.

1.4.3. Registering Optional Cordless Handsets

Base Unit & Handset

Registration is necessary for cordless handsets. You can register up to 8 cordless handsets at the base unit. The model number of the optional cordless handset is KX-TGA200CB. The included cordless handset is pre-registered at the factory and assigned the handset number 1. The handset number is used as the extension number. Optional handsets must be registered at the base unit. Only one handset can be registered at a time. Make sure that the base unit and cordless handset are in the standby mode. Registration must be completed within 1 minute.

1. Base unit: / Press [FUNCTION] .

2. Press  or  until the arrow points to “Registration”, and press .

3. Press  or  until the arrow points to “HS registration”, and press .

Handset
registering

4. Cordless handset: / Press [FUNCTION] .

5. Press  or  until the arrow points to “Registration”, and press .

6. While “HS registration”, is at the arrow, press .

Handset
registering

7. Base unit/cordless handset:

Wait until a beep sounds on the base unit and handset and until both of the displays show the assigned handset number.

Ex. Handset number is 2.

Base Unit

Handset2
registered

Cordless Handset

Handset2
registered

- To return to the standby mode, press [EXIT] .
- The handset number ([1] to [8]) will be displayed on the handset.

You can store a PIN (Personal Identification Number) to prevent unauthorized persons from registering and using a cordless handset. / Once the PIN is set, you must enter the PIN at registration.

Base Unit

1.4.4. Selecting the Dialing Mode

If your lines have touch tone service, set to "Tone". If rotary or pulse service is used, set to "Pulse". Select the mode for each line. Your phone comes from the factory set to "Tone". Make sure that the base unit is in the standby mode.

1. Press [FUNCTION] .

2. Press  or  until the arrow points to "Dial setting" and press .

3. While "Set dial mode" is at the arrow, press .

- The current settings are displayed.

Dial mode	
Line1	Line2
Tone	Tone

4. Select "Puls" (Pulse) or "Tone" by pressing  or  for each line. To move to the other line, press  or .

5. Press [ENTER] .

- A beep sounds.
- To return to the standby mode, press [EXIT] .

1.4.5. Selecting the Ringer Volume **Base Unit** **Handset**

You can set the base unit and cordless handset ringer volumes to HIGH, LOW or OFF. If set to OFF, the base unit/handset will not ring. Your phone comes from the factory set to HIGH. Programming must be carried out separately for the base unit and cordless handset(s). Make sure that the base unit/cordless handset is in the standby mode.

1. Press [FUNCTION] .

2. Press  or  until the arrow points to “Ringer setting”, and press .

3. While “Ringer volume” is at the arrow, press .

- The current volume is displayed.

4. Press  to increase or press  to decrease the volume.

- Each time you press  or , the volume will change and ring.
- To turn the ringer OFF, press and hold  until a beep sounds.

- To return to the standby mode, press [EXIT] .
- If set to OFF, “Ringer off” will be displayed in the standby mode.

To turn the ringer ON, press  in step 4.

- The ringer will sound at the LOW level.
- You can also select the ringer volume while a call is being received. Press  or  while the unit is ringing.
- To turn the ringer off for each line, use the ring group feature.

1.5. Making Calls **Base Unit** **Handset**

Two calls can be handled simultaneously on separate telephone lines by the base unit and a cordless handset (or by 2 cordless handsets).

1.5.1. With the Base Unit

When you lift the handset to make a call, the unit will automatically select a free line. Dial a phone number. To hang up, replace the handset.

1.5.1.1. Using the Digital Duplex Speakerphone

1. Press [DIGITAL SP-PHONE].

Ex. Line 1 is selected.

Talk	Line1
------	-------

- The indicator lights.
- A free line is automatically selected and the line indicator lights.

2. Dial a phone number.

Ex. Line 1 is selected.

Talk	Line1
1112222	

- The dialed number is displayed.
- If you misdial, press [DIGITAL SP-PHONE], and start again from step 1.

- After a few seconds, the display will show the length of the call.

3. When the other party answers, talk into the MIC (microphone).

4. To hang up, press [DIGITAL SP-PHONE] .

○ f f
00-02-50

- The indicator lights go out.
- In step 1, you can select a line by pressing a line button whose indicator is not lit, instead of pressing / [DIGITAL SP-PHONE] .
- If more than one handset is in use, you may not be able to make a call. In that case “System is busy. Please try again later.” is displayed.
- If the unit detects a problem, an error message will be displayed.

1.5.1.2. To dial After Confirming the Entered Number

1. Enter a phone number.

1112222■

- If you misdial, press [CLEAR] . Digits are erased from the right.
 - To cancel, press [EXIT] .
2. Lift the handset or press [DIGITAL SP-PHONE] .
- The line number is displayed.
 - After a few seconds, the display will show the length of the call.
 - You can press a line button instead of / [DIGITAL SP-PHONE] .
3. When the other party answers, talk into the handset or MIC.
4. To hang up, replace the handset or press [/ DIGITAL SP-PHONE] .

1.5.1.3. To Redial the Last Number Dialed

Lift the handset or press [DIGITAL SP-PHONE] , and press / [REDIAL] .

1.5.1.4. To Adjust the Handset Volume (High, Medium or Low) or the Speaker Volume (8 levels)

Press  or  while talking.

- Each time you press  or , the volume level will change.

Ex. Handset volume: High

Low  High

Ex. Speakerphone volume: 8

Low  High

1.5.1.5. To Redial Using the Redial List

The last 10 phone numbers dialed with the base unit are stored in the redial list.

1. Press [REDIAL].

- The last number dialed is displayed.

2. Press [REDIAL] until the desired number is displayed.

- You can scroll between numbers by pressing  or .
- To exit the list, press [EXIT].

3. Lift the handset or press [DIGITAL SP-PHONE].

- To erase an item, repeat steps 1 and 2, and press [CLEAR].
- If “No items stored” is displayed, the list is empty.

Hands-free Digital Duplex Speakerphone
For best performance, please note the following:

- Talk alternately with the caller in a quiet room.
- If the other party has difficulty hearing you, press  to decrease the speaker volume.
- If the other party's voice from the speaker cuts in/out during a conversation, press  to decrease the speaker volume.
- You can switch to the handset by lifting it up. To switch back to the speakerphone, press [DIGITAL SP-PHONE].

1.5.1.6. To Put a Call on Hold

Press [HOLD].

- “Hold” and the line number are displayed.
- If using the handset, you can replace it on the cradle.
- If a call is kept holding for 30 seconds, a warning tone will sound.
After 2 minutes the automated attendant will respond to the caller and he/she can call a handset or leave a message following the

Incomplete Call Handling Menu.

1.5.1.7. To Release the Hold

Press the line button whose indicator is flashing.

- **Cordless handset users can release the hold by pressing the line button. If another phone is connected on the same line, the hold will also be released by lifting its handset.**

1.5.1.8. What Line Indicators Mean

Off	The line is free.
On	The line is being used.
Flashing	A call is on hold. The Automated Attendant System or Answering System is responding to a call.
Flashing quickly	A call is being received.

1.5.2. With the Cordless Handset

1. Press [TALK].

Ex. Line 1 is selected.

- **A free line is automatically selected and the line status icon is displayed.**

2. Dial a phone number.

Talk	Line1
1112222	

- The dialed number is displayed.
- After a few seconds, the display will show the length of the call.

3. To hang up, press [TALK] or place the handset on the charger.

- In step 1, you can select a line by pressing the line button whose line status icon is not displayed, instead of pressing / [TALK] .
- If the base unit and another handset or 2 other handsets are in use, you may not be able to make a call. In the case “System is busy.Please try again later.” is displayed.
- If the unit detects a problem, an error message will be displayed.

1.5.2.1. To Dial After Confirming the Entered Number

1. Enter a phone number.

1112222 ■

- If you misdial, press [CLEAR] . Digits are erased from the right.
- To cancel, press [EXIT] .

2. Press [TALK] .

- You can press a line button instead of pressing [/ TALK] .
- The line number is displayed.
- After a few seconds, the display will show the length of the call.

3. To hang up, press [TALK] or place the handset on the charger.

1.5.2.2. To Adjust the Receiver Volume (High, Medium or Low)

Press  or  while talking.

- Each time you press  or  , the volume level will change.

Ex. High

1.5.2.3. Lighted Handset Keypad

The handset dialing buttons will light when you press a button, and flash when a call is received. The lights will go out about 10 seconds after pressing a button, lifting the handset off the charger or answering a call.

1.5.2.4. To Redial the Last Number Dialed

Press [TALK] and press [REDIAL] .

1.5.2.5. To Redial Using the Redial List

The last 10 phone numbers dialed with the handset are stored in the redial list.

1. Press [REDIAL] .

- The last number dialed is displayed.

2. Press [REDIAL] until the desired number is displayed.

- You can scroll between numbers by pressing  or .
- To exit the list, press [EXIT] .

3. Press [TALK] .

- To erase an item, repeat steps 1 and 2, and press [CLEAR] .
- If “No items stored” is displayed, the list is empty.

1.5.2.6. To Put a Call on Hold

Press [HOLD] .

- “Hold” and the line number are displayed.
- The line status icon flashes on the display.
- If a call is kept holding for 30 seconds, a warning tone will sound.
After 2 minutes the automated attendant will respond to the caller and he/she can call the base unit or another handset or to leave a message following the Incomplete Call Handling Menu.

1.5.2.7. To Release the Hold

Press the line button.

- The base unit and other handset users can release the hold by pressing the line button. If another phone is connected on the same line, the hold will also be released by lifting its handset.

1.6. Answering Calls **Base Unit** **Handset**

Two calls can be handled simultaneously by the base unit and a cordless handset (or by 2

cordless handsets). When a call is being received, the unit rings and “Incoming call” is displayed. The called line indicator flashes quickly on the base unit and the line status icon flashes quickly on the handset display. The line is automatically selected when you answer the call. If you subscribe to a Caller ID service, the calling party information will be displayed after the first ring. In order to view the Caller ID information, please wait until the second ring to answer a call.

1.6.1. With the Base Unit

You can answer a call by simply lifting the handset. To hang up, replace the handset.

1.6.1.1. Using the Digital Duplex Speakerphone

1. Press [DIGITAL SP-PHONE] .

- The indicator lights.
- The called line indicator light stops flashing.

2. Talk into the MIC (microphone).

3. To hang up, press [DIGITAL SP-PHONE] .

- The indicator lights go out.

1.6.2. With the Cordless Handset

Press [TALK] .

- The called line status icon stops flashing.
- You can also answer a call by pressing any dialing button / [0] to [9] , [*] or [#] (—Any Key Talk).

OR

If the handset is on the charger, just lift up. (This is not possible when the Auto Talk feature is set to OFF.)

-You can answer a call by pressing the called line button instead of pressing [DIGITAL SP-PHONE] or [TALK].

-When the base unit and handset ringer volumes are set to OFF, they will not ring.

1.7. Intercom **Base Unit** **Handset**

A 2-way intercom is possible between the base unit and a cordless handset or between two cordless handsets. Each number assigned to a handset at registration is the extension number. The base unit extension number is 0.

1.7.1. Making Intercom Calls

1.7.1.1. With the Base Unit

1. To page all handsets, press INTERCOM [ALL] . To page one handset, press the corresponding INTERCOM button ([1] to [8]).

Ex. Paging all Handsets

Paging [ALL]

Ex. Paging Handset 1

Calling [0] → [1]

- The paged handsets ring for 1 minute.
 - To stop paging, press [DIGITAL SP-PHONE] .
2. When the other party's voice is heard, lift the handset or talk into the MIC (microphone).

Ex. Handset 1 answered.

Intercom
00-00-00

- The display will show the length of the call and the handset in-use icon.
3. To end the intercom, replace the handset or press [DIGITAL SP-PHONE] .

Off
00-10-08

- If you page all handsets, you can only talk with the handset user who answers first.
- Using this feature, you can locate a misplaced cordless handset.

1.7.1.2. With the Cordless Handset

1. Press [INTERCOM] .

- 2. To page the base unit, enter [0]. To page another handset, enter the extension number ([1] to [8]).**

Ex. Handset 1 paging Base Unit

- The base unit or the paged handset rings.
 - To stop paging, press [INTERCOM] .
 - After the paged party answers, the display will show the length of the call.
- 3. To end the intercom, press [TALK] or place the handset on the charger.**

1.7.2. Answering Intercom Calls

With the base unit:

After the rings, lift the handset or press / [DIGITAL SP-PHONE] .

To end the intercom, replace the handset or press / [DIGITAL SP-PHONE] .

Ex. Handset 2 paging

With the cordless handset:

After the rings, press [TALK] or lift the handset off the charger.

To end the intercom, press [TALK] or place the handset on the charger.

Ex. Base Unit paging Handset 1

Call[1]←[0]

During an intercom call:

- If an incoming call is being received, the line indicator on the base unit will flash quickly or the handset user will hear two tones (incoming call tone).
To answer, press the relevant line button.
- If the unit detects a problem, an error message will be displayed.

- When the base unit and handset ringer volumes are set to OFF, they will not ring.

1.8. Transferring a Call **Base Unit** **Handset**

You can transfer an external call between the base unit and a cordless handset, or between two cordless handsets.

1.8.1. With the Base Unit

1. During a call, press the corresponding TRANSFER button ([1] to [8]) to page the handset. / To page all handsets, press TRANSFER [ALL] .

- The call is put on hold and the line indicator flashes.

2. If required, wait for the handset user to answer, and you can announce the transfer. / If not required, go to step 3.

- If the paged party does not answer, press the relevant line button.

3. To complete the transfer, replace the handset or press / [DIGITAL SP-PHONE] .

To answer a transferred call with the base unit:

Lift the handset or press [DIGITAL SP-PHONE] after the rings.

- After the paging party hangs up, you can talk to the outside caller.
- You can press the relevant line button instead of pressing / [DIGITAL SP-PHONE] to talk to the outside caller.

1.8.2. With the Cordless Handset

1. During a call, press [TRANSFER] .

- The call is put on hold and “Press extension No. to transfer” is displayed.
 - 2. To page the base unit, enter [0] . / To page another handset, enter the extension number ([1] to [8]).
 - 3. If required, wait for the paged party to answer, and you can announce the transfer. / If not required, go to step 4.
 - If the paged party does not answer, press the relevant line button.
 - 4. To complete the transfer, press [TALK] or place the handset on the charger.
- To answer a transferred call with the cordless handset:
Press [TALK] or lift the handset off the charger after the rings.
- After the paging party hangs up, you can talk to the outside caller.
 - You can press the relevant line button instead of pressing / [TALK] to talk to the outside caller.
 - If the paged party does not answer within 30 seconds after you hang up, the transferred call will be returned to you. Press the relevant line button to take the call. If you do not answer the recalled call within 2 minutes, the automated attendant will respond to the caller and he/she can call the base unit or a handset or leave a message following the Incomplete Handling Menu.
 - Any users can take a transferred call by pressing the relevant line button.

3. EXPLANATION OF THE DIGITAL TELECOMMUNICATION TECHNOLOGY (FHSS, IOM-2, PCM, IPC)

3.1. FHSS (Frequency Hopping Spread Spectrum)

This telephone is using IC chip for WDTC (World Digital Cordless Telephone) and is the cordless telephone system that can use multiple portable unit simultaneously. The explanation of this system is mentioned as below. / This system uses a Time Division Multiple Access/Time Duplex (TDMA/TDD) scheme that transmitting and receiving frequency of the base unit and cordless handset is shared in the same frequency. The construction of data in frequency that is sent and received is as below. It consists of 4 slots from the base unit to the cordless handset, and 4 slots from the cordless handset to the base unit, total 8 slots in 10ms. (Signal area is “t”, “g” area is called as guard slot.) / By this slot system, simultaneous air link and communication

between 4 cordless handsets and the base unit can be realized. One communication between cordless handset and the base unit is done by one slot from the base unit to cordless handset, and one slot from cordless handset to the base unit. / DSS makes spectrum spread by multiplying carrier signal by PN code. / The purpose to make spectrum spread is to reduce power density per time and per band. / On the other hand, FHSS makes spectrum spread by changing channel every 10 ms according to PN code. Also the purpose to make spectrum spread is to reduce power density per time and per band.

A-field

Each kinds of DATA: ch data, line condition, etc.

B-field

Acoustic DATA

Sync-field

Base unit (cordless handset) adjusts the timing of reception so that reception of base unit (cordless handset) can correspond to transmission of cordless handset (base unit). It is necessary for sync-field that cordless handset gets synchronization.

When cordless handset is synchronized with base unit at stand-by mode, cordless handset is in LCD (Low Duty Cycle) mode. In this mode, power consumption is low. While cordless handset is in stand-by mode, base unit send line information and bell information to cordless handset.

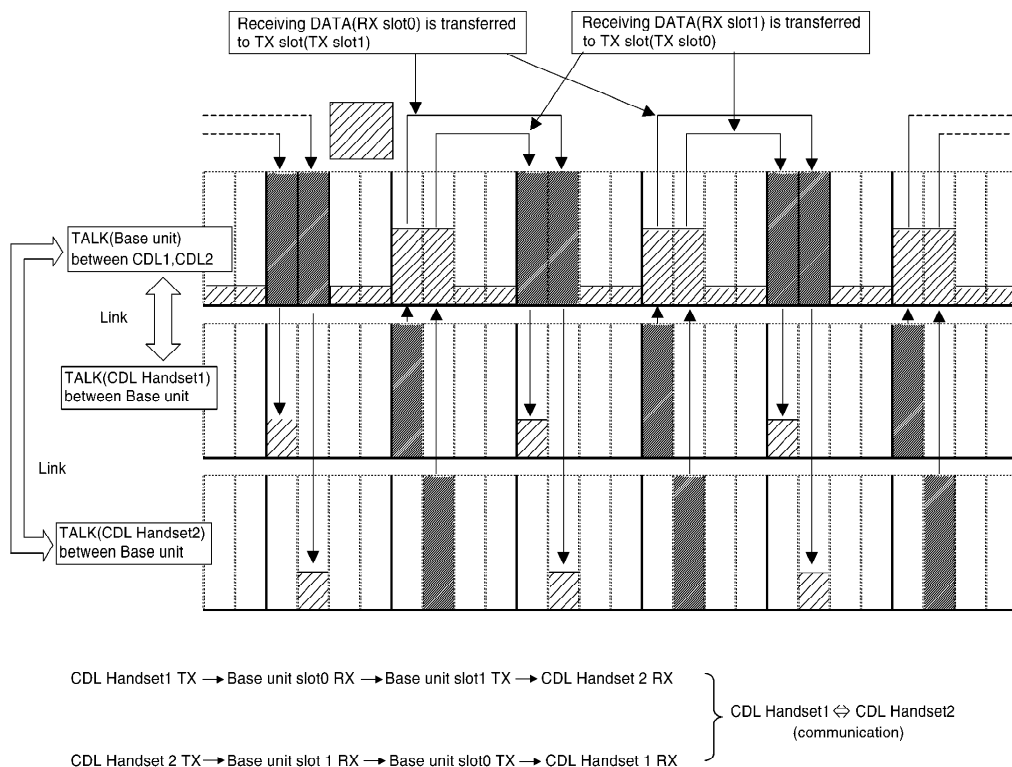

When user communicate with other party by cordless handset, cordless handset is sending and receiving like upper figure.

When user1 and user2 communicate with each other party, slots for transmission and reception of base unit is used simultaneously. / This communication can be done up to 4 pairs of communication.

3.1.1. Intercom between CDL Handset1 and CDL Handset2

Intercom communication between CDL Handset1 and CDL Handset2 is carried out by below system.

Intercom between 2 cordless handsets through base unit can be done like the upper figure by using pairs of slot.

3.1.2. Rx Data Wave (when synchronized)

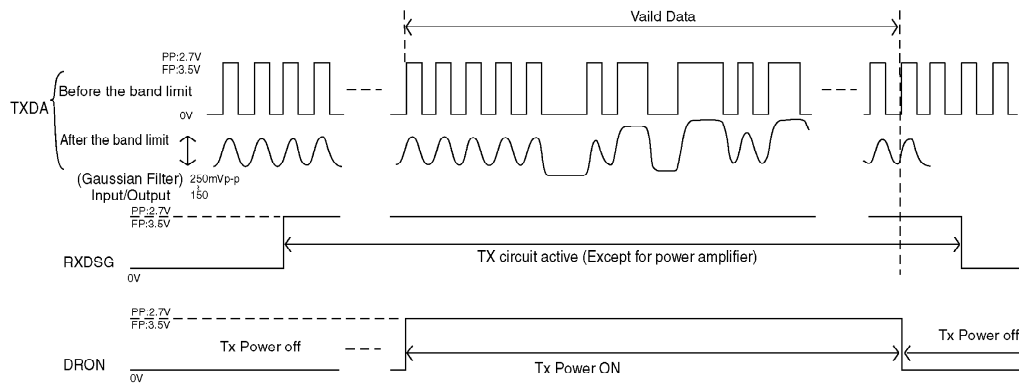

(RX)

When Preamble data (0101-0101) is received, based on the receiving wave it goes into the mode which decides the data judging level (the comparator reference level) while RXDSG is “High”. → **Sampling Mode**

When the received preamble data (0101-0101) reached to about 8 bits, RXDSG goes to Low from High and it stops sampling to determine the data judging level. Then data reading is started. → **Hold Mode**

The unit enters the Hold mode, and the data will be synchronizes as soon as the sync. word is gained.

3.1.3. Tx Data Wave

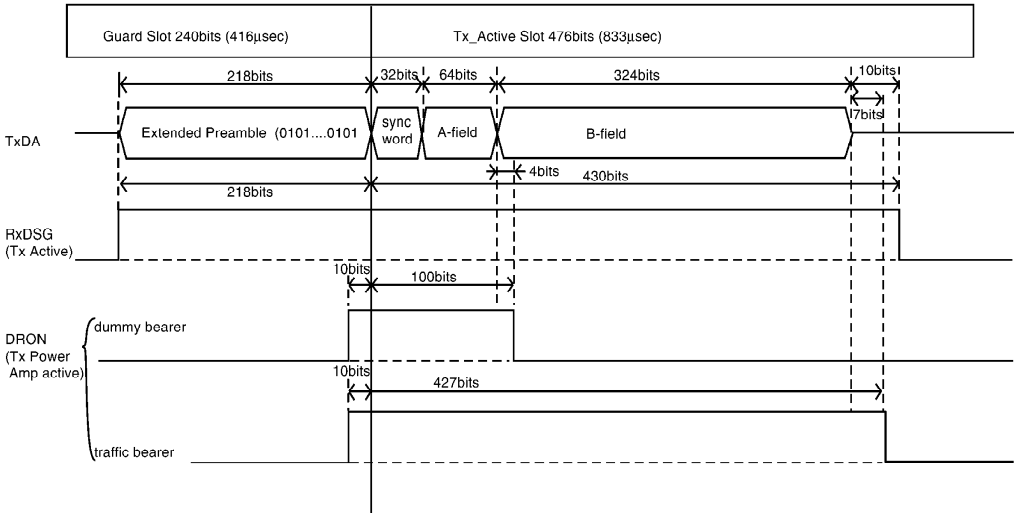

(TX)

The transmitting circuit is activated with RXDSG “H”. (The data is not transmitted because TX Final power amplifier is OFF.)

When DRON becomes “H”, the Final power amplifier is turned ON to start transmitting.

3.1.4. Tx Slot Timing

$$1\text{bit} = \frac{1}{0.576} \mu\text{sec}$$

3.1.5. Rx Slot Timing

When the preamble of about 8 bits is found in no sync., the Sample mode turns to the Hold mode. Then it returns to the sample mode if the sync. word can not be found.

3.2. IOM-2 Interface

IOM-2:

This standard defines an industry standard serial bus for interconnecting telecommunications ICs. It covers line card, and terminal architectures for ISDN and analog loop applications. / IOM-2 is revised from IOM (ISDN Oriented Modular Interface).

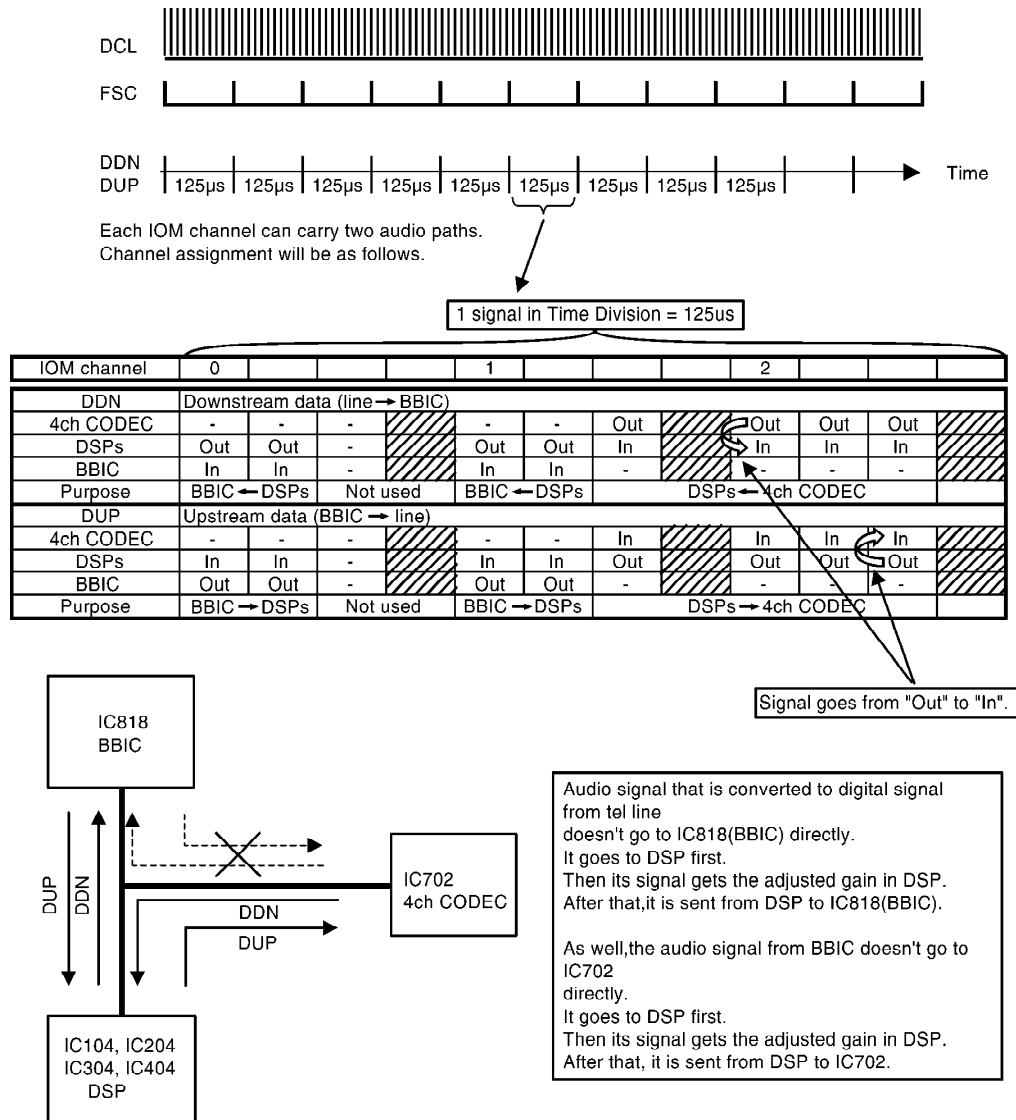

ISDN:

Integrated Service Digital Network

IOM-2 interface consists of the following signals.

Signal	Direction with respect to protocol board	
DDN	Input	Data downstream, from BBIC to 4ch CODEC through DSP
DUP	3-state output	Data upstream, from 4ch CODEC to BBIC through DSP, except in selected time slots.
DCL	Output	IOM clock, 1536 kHz (two clocks per bit)
FSC	Output	Frame sync signal, 8 kHz

*Digital signal that is generated in Time Division is sent and received every time of 8 kHz (125 μ s).

3.3. PCM Interface

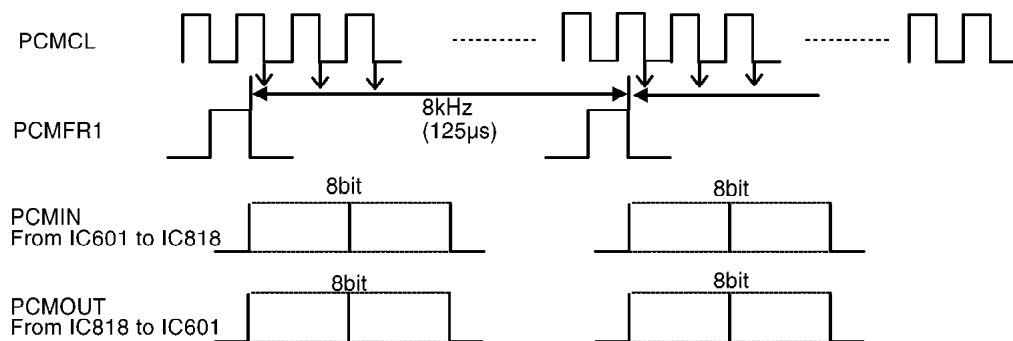

The PCM interface is used to connect the CODEC IC (IC601) that convert the audio signal to handset and speakerphone from digital to analog or from analog to digital to BBIC (IC818).

The interface consists of the following signals.

Signal	Direction	Function
PCMIN	From IC601 to IC818	Data
PCMOUT	From IC818 to IC601	Data
PCMCL	From IC818 to IC601	Clock, 1.536 MHz
PCMFR1	From IC818 to IC601	Frame signal, 8kHz, indicates the time slot in the PCM stream in which the voice should be driven.

Timing PCM-Interface

PCM data between IC601 and IC818 is received and transmitted in 8 bits every 125 μ s, simultaneously. PCM data is received and transmitted.

3.4. IPC Interface

This base unit has two CPUs. / Mainly main CPU (IC805) has the function to control IOM-2, baseband and RF. / Sub CPU (IC701) has the function to control the application area of DSP, key matrix, line control (caller-ID, call waiting) and LCD. / To perform total function, the communication between main CPU and sub CPU should be needed.

(Inter-processor communication channel)

This connection is used to link the two processor, the 16-bit CPU (Main CPU: IC805, Sub CPU: IC701).

Signal	IC805 Pin No	IC701 Pin No	Function
IPCIN	10	59	Data from Sub CPU (IC701) to Main CPU (IC805)
IPCOUT	8	61	Data from Main CPU (IC805) to Sub CPU (IC701)
IPCCL	12	63	Clock generated by Main CPU at up to 500 k s.
BUSY_PORT	94	74	Ready/Busy from Sub CPU to Main CPU.

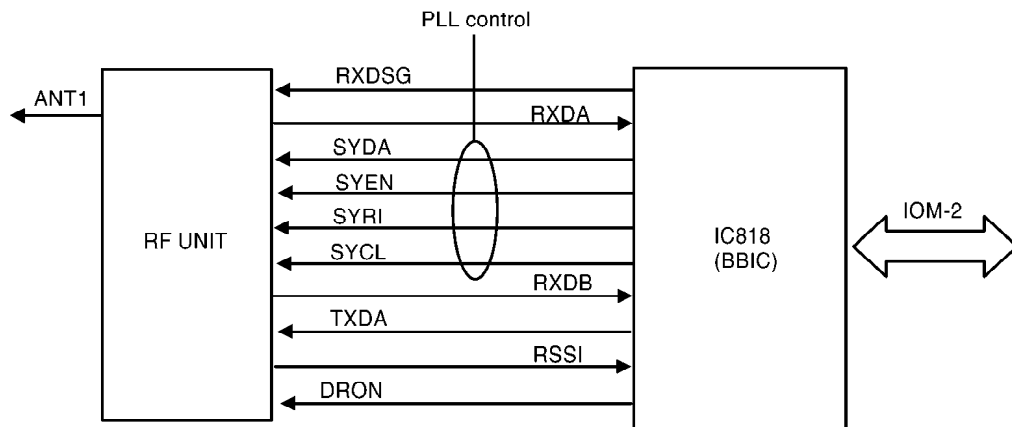

Except this data communication between IC805 and IC701, sub CPU (IC701) and main CPU (IC805) are performing the below data communication.

- CPU reference clock: 10 MHz (From IC805 to IC701)
- reset (From IC805 to IC701)
- stop (From IC805 to IC701)

3.4.1. FHSS (Frequency hopping spectrum spread) system consists of BBIC(IC818) and RF UNIT

This system is explained as below.

1. Signal is modulated in Frequency modulation.
2. Carrier signal that is modulated is hopped by BBIC's control.
3. Hopping channel is from 0 to 93ch.

3.4.2. RF unit

PQLZ10011Z (For Cordless Handset)

PQWPTG2000KT (For Base Unit)

Pin Description

pin no.	Pin name	Input / Output	Description
13	VCC	I	Power Supply BASE UNIT: 3.3 - 4.0V CORDLESS HANDSET: 3.3 - 4.0V
3	ANT1	I	BASE UNIT: Select Main Antenna, "H" active CORDLESS HANDSET: No Connection
4	ANT2	I	BASE UNIT: Select Diversity Antenna, "H" active CORDLESS HANDSET: Low Power Mode*
9	RXDSG	I	Receiver Sample & Hold (Data Slice) Gating and Driver Mode Selection
8	RXDA	O	Receiver Data Output (DIGITAL OUT)
7	RXDB	O	RXDA Inverted
16	SYDA	I	PLL Data
17	SYEN	I	PLL Enable
18	SYRI	I	System Reference Frequency Input (10.368 MHz, 100mV rms min.)
19	SYCL	I	PLL Clock
Other pins	GND	-	Pins: 1, 2, 5, 6, 10, 11, 12, 14, 15, 20, 21, 23, 24, 25, 26, 27, 28, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42
22	TXDA	I	TX Data Input Gaussian DATA (BT=0.5)
29	RSSI	O	Radio Signal Strength Indicator (ANALOG OUT)
30	DRON	I	Power Amplifier On (DIGITAL)

6.11. PRINTED CIRCUIT BOARD (Charger)

7. CIRCUIT OPERATION (BASE UNIT)

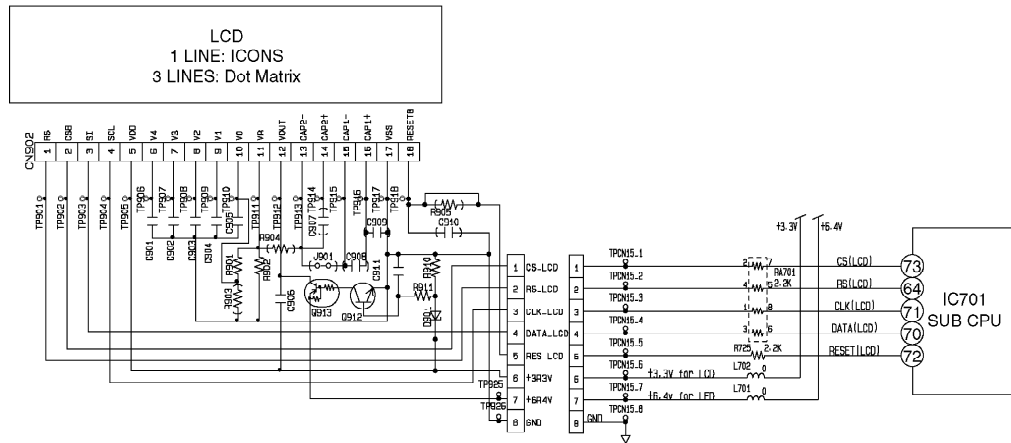

7.1. LCD Circuit

This LCD incorporating a COG IC uses one line for icon display and three lines for character display.

The COG LCD is controlled by 4 control lines (CSB, SCL, SI and RS) from IC701.

Two systems are used for power supply, a 3.3 V system and a 6.4 V system. The 3.3 V system supplies power for the display and the 6.4 V system supplies power for LCD contrast. The LCD boots up using the 3.3 V system, so Q912 and Q913 are used to control the 6.4 V system so that it is activated later.

The LCD contrast is set by the voltage at pin 11, so the output voltage from pin 10 is divided at R902 and R901.

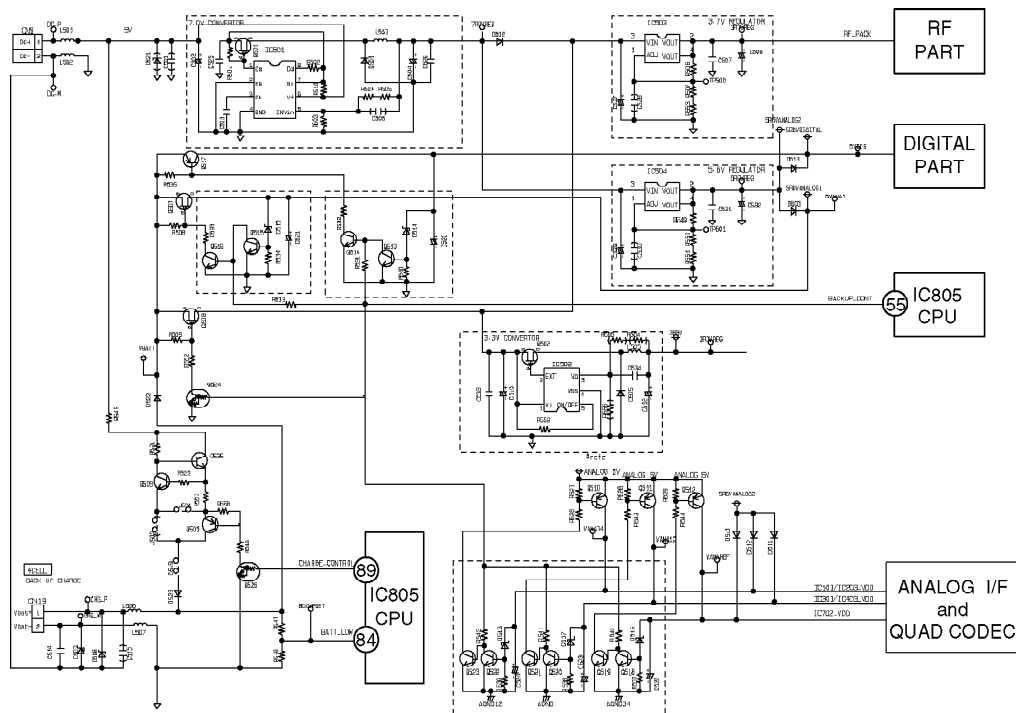

7.2. Battery Power Supply

The circuit shown below is the circuit which switches the power supply form AC adaptor to power supply from the battery (when the battery is connected) if power supply from the AC adaptor is cut.

Whether or not the battery is connected is conveyed to pin 84 of IC805 by the voltage division of R547 and R548. At this time, if the power from the AC adaptor is interrupted and the AC DOWN signal is input, pin 55 of IC805 outputs a HIGH signal which turns on Q514, Q516, Q524, Q519, Q521 and Q523, so Q517, Q507, Q508, Q512, Q511 and Q510 connected to these are turned on and power is supplied to each circuit.

However, this circuit operates only after power from the AC adaptor is cut; it does not operate if power is supplied from the battery from the beginning.

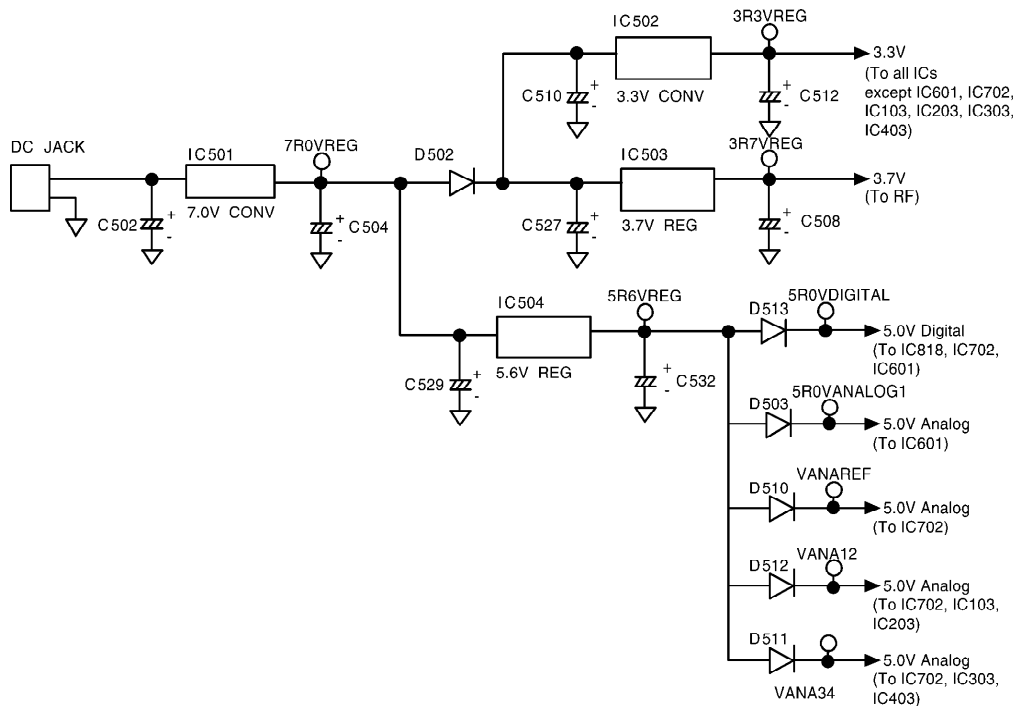

7.3. Power Supply Circuit

As indicated in the illustration, the various voltages are supplied constantly to their respective blocks.

IC501 and IC502: step down DC-DC Converter

IC503 and IC504: Low-dropout Linear Regulator

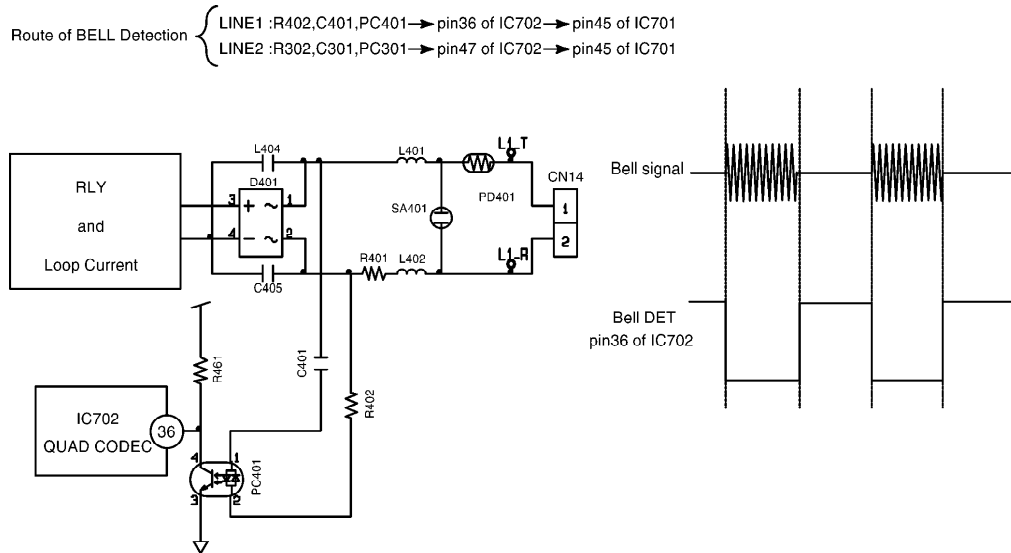

7.4. Bell Detection Circuit (In case of Line1)

When the Bell signal is input between T/R, its waveform is shaped through C401 to PC401, then fed to pin 36 of CODEC IC702.

When the CODEC detects the Bell signal, it sends a signal from pin45 of Sub CPU IC701. To obtain a display synchronized with the bell signal, an L1LED cont signal is output from pin79 of IC701 and then L1LED is flashed.

Cordless handset receive a bell signal from the base unit through RF (The data path: CPU IC805, PLD IC801, Baseband IC818 to RF UNIT) and then cordless handset ringers are on. When the cordless handset is switched from the STANDBY to TALK, the base unit stop the bell sound and catch the line.

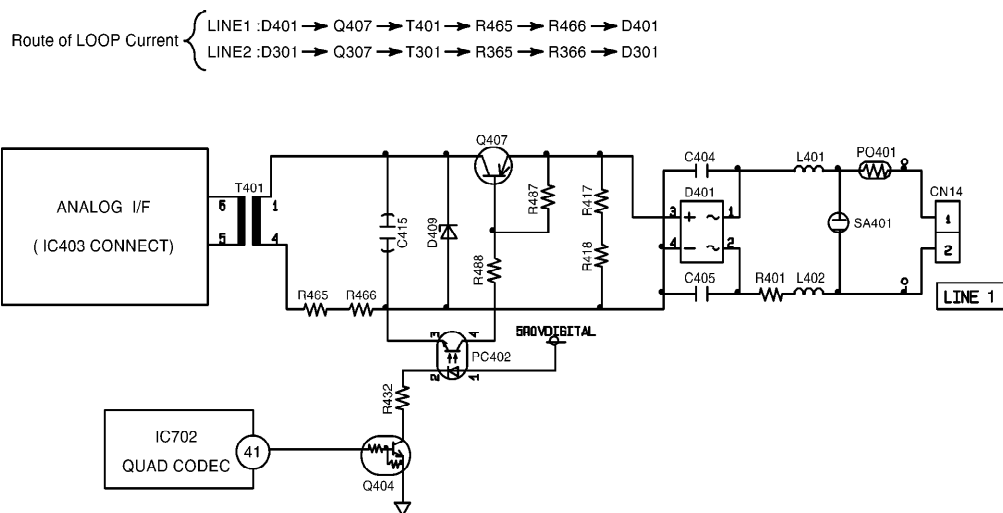

Caution

Sampling is performed every 2 ms and it is determined that a Bell signal exists if "Low" is detected for 57% or above out of 44 samples.

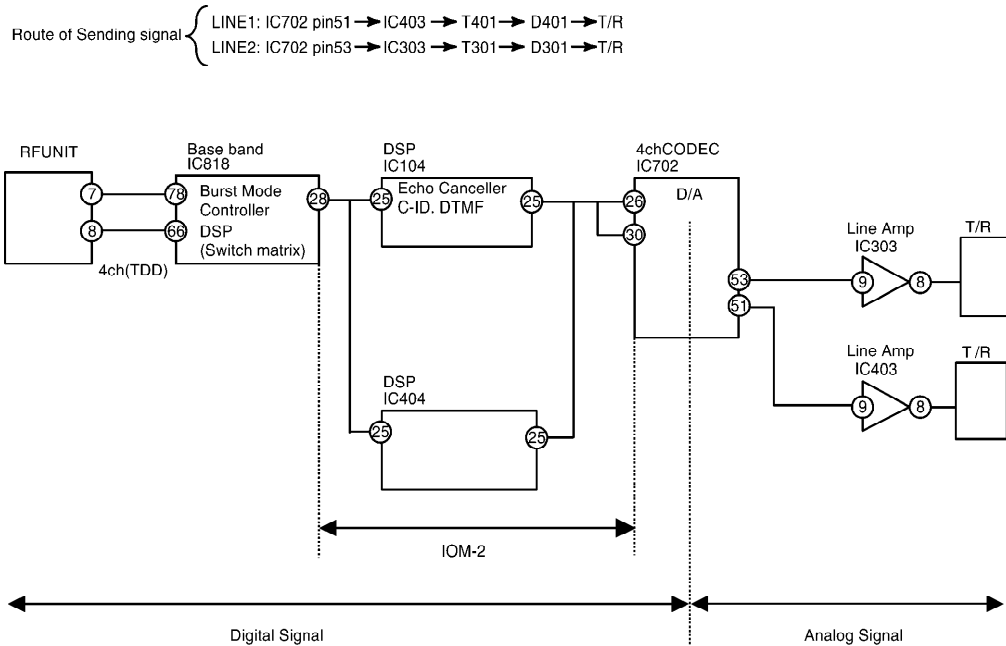

7.5. Line Interface

When off-hook (In talk or TAM status), as for Line1, pin 41 of IC702 change to high level, causing Q407 and PC402 turn on and line loop current flows. A telephone line is seized in result. The loop current flows from D401, Q407, T401, R465 and R466. When dialing, pin41 of IC702 outputs a pulse signal so that it switches the line loop on and off to generate the dial pulse signal.

7.6. Line Sending Signal (Portable talk mode)

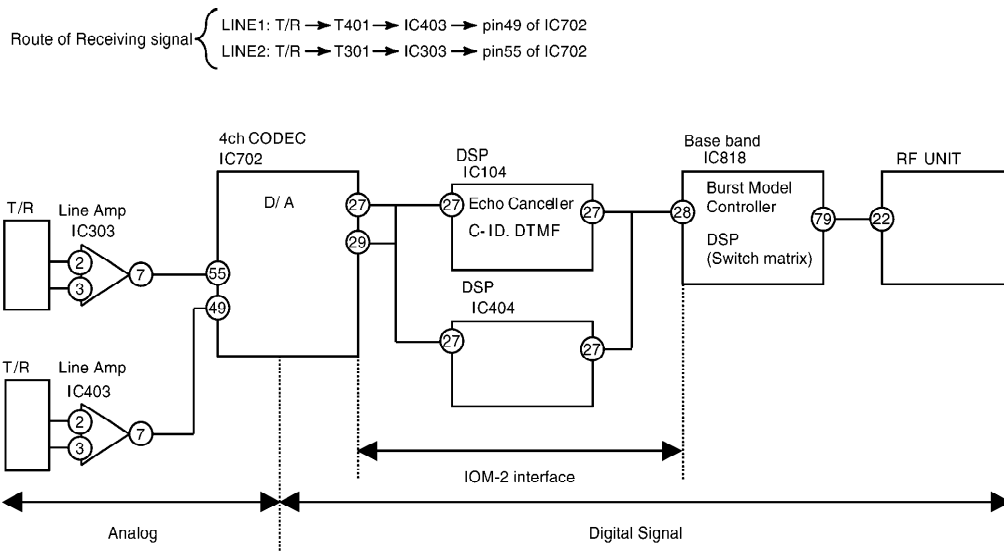

The audio signal and control data for 2 lines are sent by Time Division Duplex (for IOM-2 interface), sharing the same signal path. This enables to use the 2 line at the same time. / The digital RX data and inverted data from pin7 and pin8 of RF Unit are input to pin78 and pin 66 of IC818. IC818 converts the data to 8-bit u-law-encoded and send to pin25 of select DSP IC104 and IC404 by the use line number. DSP IC104 and IC404 executes echo cancellation and DTMF generation for Line1 - Line2 each. Then the data is sent to pin26 and pin 30 of IC702. / Then the data is sent to pin26 and pin30 of IC702. IC702 converts the data into analog audio signal. Then the audio signal is sent to the LINE.

7.7. Line Receiving Signal

Portable talk mode

The audio signal and control data for 2 lines are sent by Time Division Duplex (for IOM-2 interface), sharing the same signal path. This enables to use the 2 line at the same time. / The audio signal from line transformer T301 - T401 is input to IC301 - IC403. IC301 - IC403 comprise line amplifier. These signals are output to pin55, 49 of IC702, according to Line2 - Line1. IC702 converts the signals into 8bit u-law data and sends to pin27 of IC104 and IC404. DSP IC104 and IC404 execute echo cancellation and DTMF reception for one channel each, and send the data to IC818. IC818 converts the data into digital TX data, then sends to pin22 of RF Unit.

7.8. Side Tone Circuit

The circuit diagram below shows the LINE interface of each LINE with the telephone line, and the interface circuit between the 4-channel CODEC of IC702.

This circuit is comprised of the level control for transmission and reception, and the side tone circuit.

Transmission Route:

Reception Route:

The side tone cancellation circuit operates so that output of pin 14 of IC403 is input to pin 3 of IC403 via C469, R437, C439 and R469 to cancel the signal returned from the line that is input to pin 2 of IC403

Route of side tone cancellation circuit:

7.9. ALC Circuit (Auto Level Control)

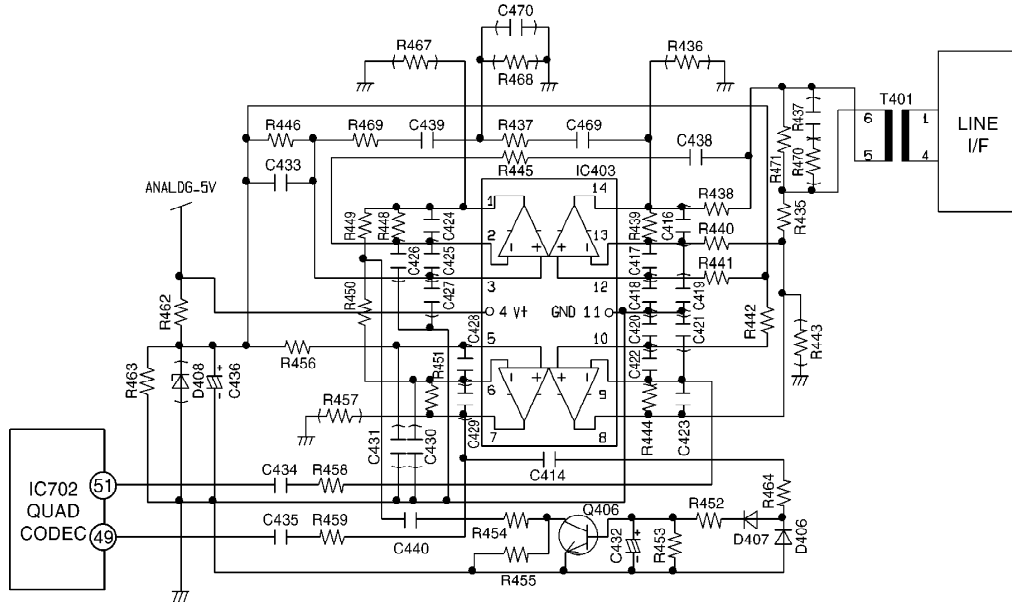

This circuit prevents the input of distorted waveforms to IC702 when a large signal is received from the line.

This is because normal analog-to-digital conversion cannot be performed if distorted waveforms are input during analog-to-digital conversion.

The circuit monitors the amplifier output and lowers the input level of the amplifier if it reaches a certain level.

Operation Route:

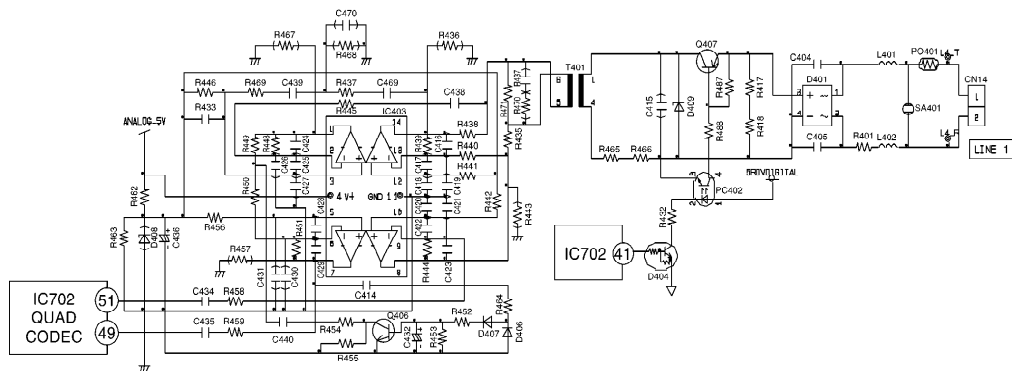

LINE1: pin7 of IC403 → R464 → D407 → R452 → Q406 → R454 → C440 → R450 → pin6 of IC403
 LINE2: pin7 of IC303 → R364 → D307 → R352 → Q306 → R354 → C340 → R350 → pin6 of IC303

7.10. DTMF SIGNAL

When the DTMF data from the Handset is received, the DTMF signal is output from some one IC303, IC403, according to the Line used, and sent to the line through IC702.

LINE1: IC702 pin51 → IC403 → T401 → D401 → T/R
 LINE2: IC702 pin53 → IC303 → T301 → D301 → T/R

7.11. Telephone Answering

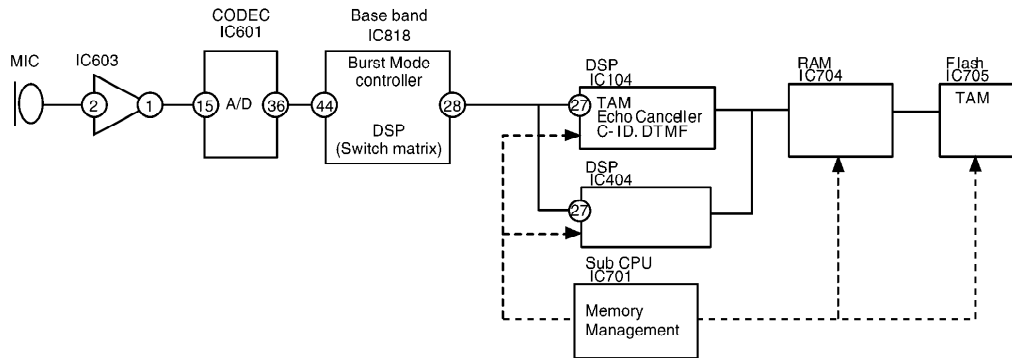

Function:

When in Telephone Answering Mode, the unit automatically answers the call, asking the caller to leave a message, then records the caller's incoming message.

7.11.1. Mic Input Signal Path

Mic → pin2 of IC603 → pin15 of IC601 → pin44 of IC818 → pin27 of some one DSP IC104 and

IC404 → Data lines of IC704 → Data lines of IC705

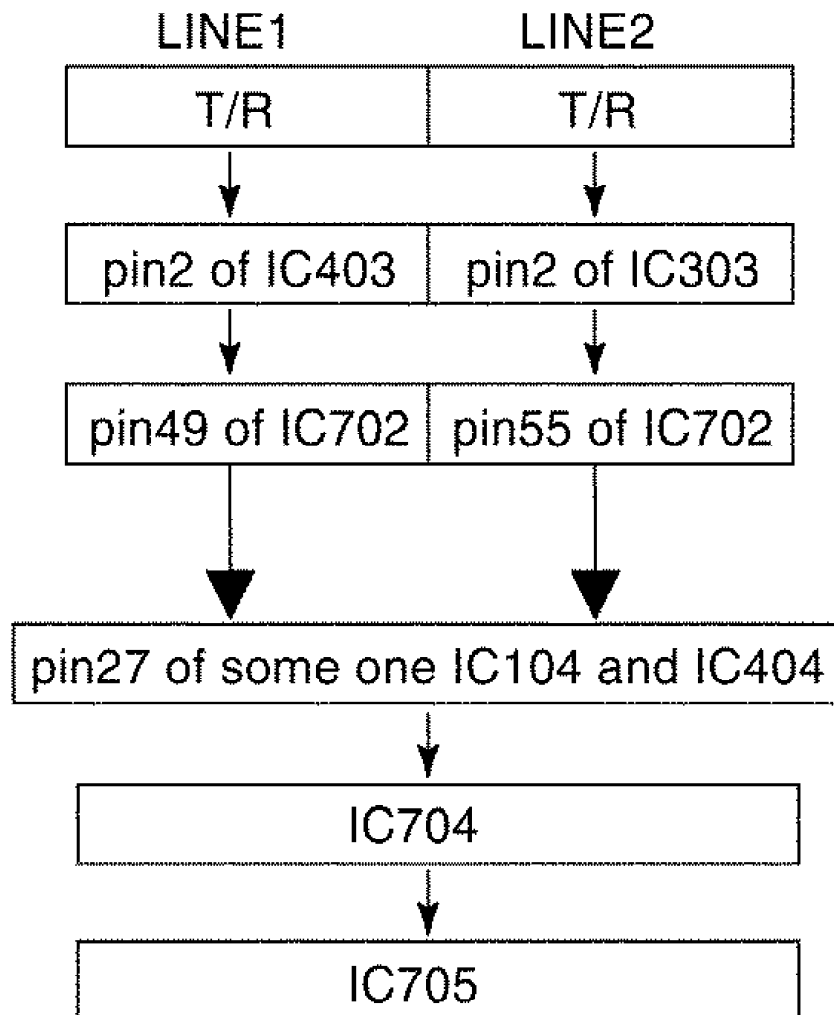

7.11.2. Reception signal path (In case of Line1)

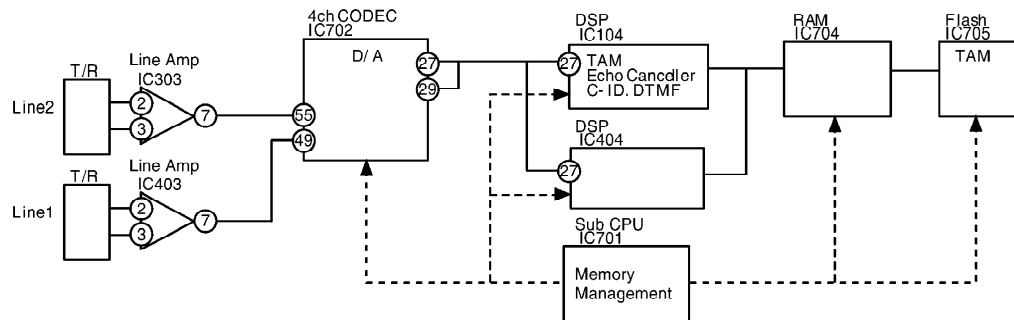

The input signal from the telephone line is sent through the circuit via the following path: / T/R → pin2 and pin3 of IC403(differential) → pin49 of IC702 → pin27 some one DSP of IC104 and IC404 → Data lines of IC704 → Data lines of IC705

DSP IC104 and IC404 provides voice prompting, voice recording and playback function. The voice data are stored in the Flash memory IC705.

The voice data is controlled via Sub CPU IC701. Sub CPU manages Flash memory IC705 and IC704 so that DSP IC104 and IC404 can use the same Flash memory.

Telephone Answering Mode

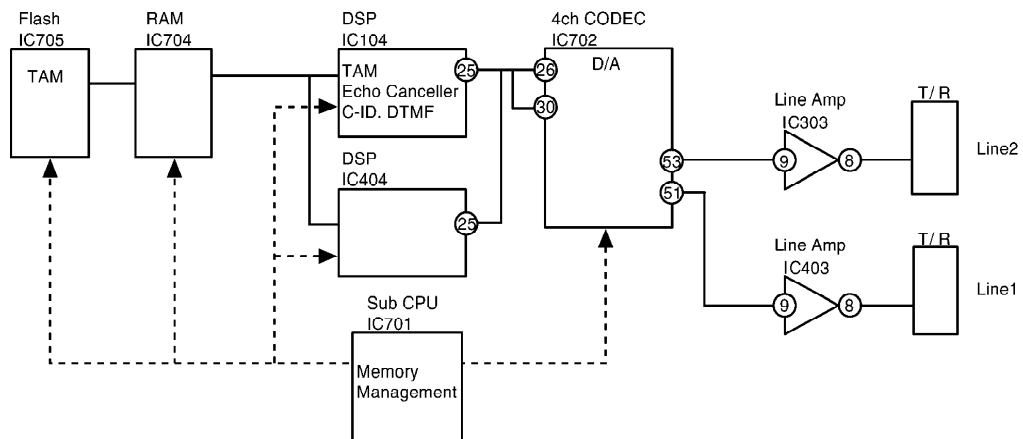

7.11.3. Transmission Signal Path (In case of Line 1)

The output signal to the telephone line is sent through the circuit via the following path: / IC705
 → IC704 → 25pin of some one DSP IC104 and IC404 → pin26 and pin30 of IC702 → pin9 of IC403 → T/R

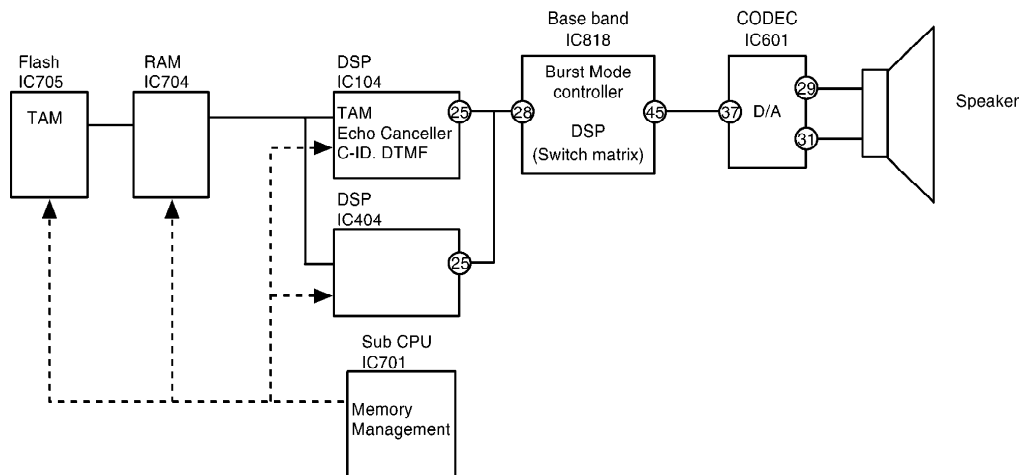

Telephone Answering Mode

7.11.4. Speaker Output Signal Path

IC705 → IC704 → 25pin of some one DSP IC104 and IC404 → pin28 of IC818 → pin37 of IC601 → SP

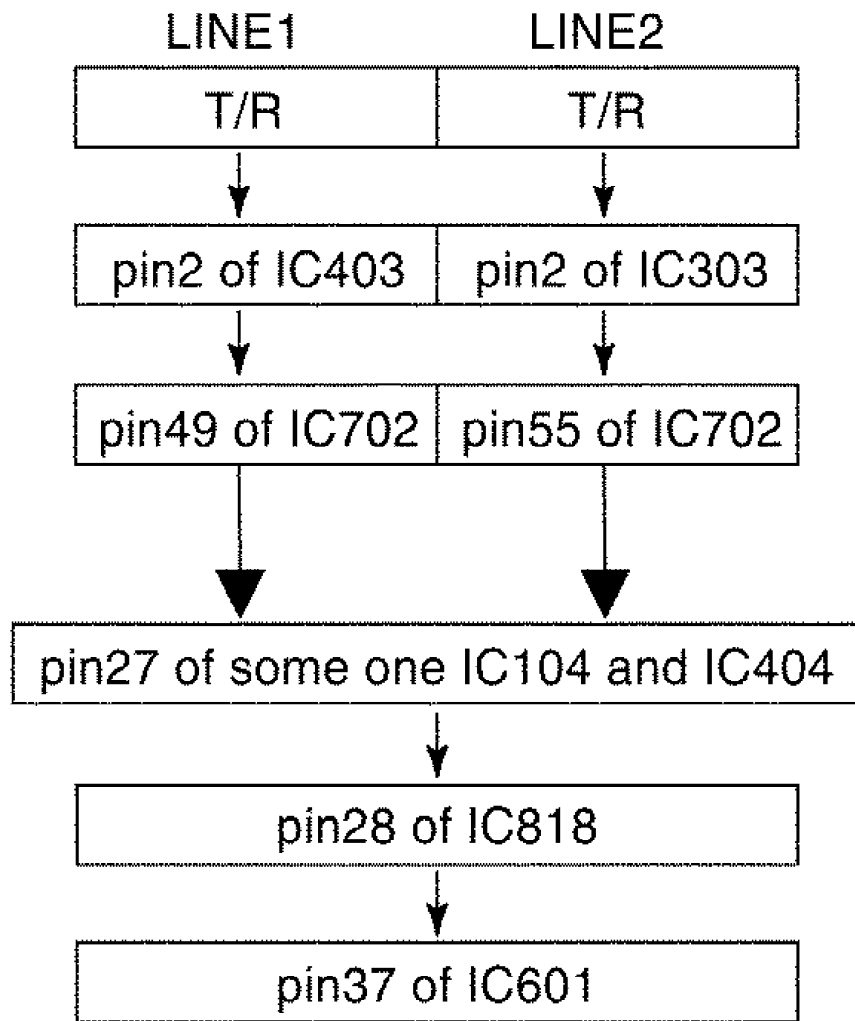

7.12. Speakerphone Mode

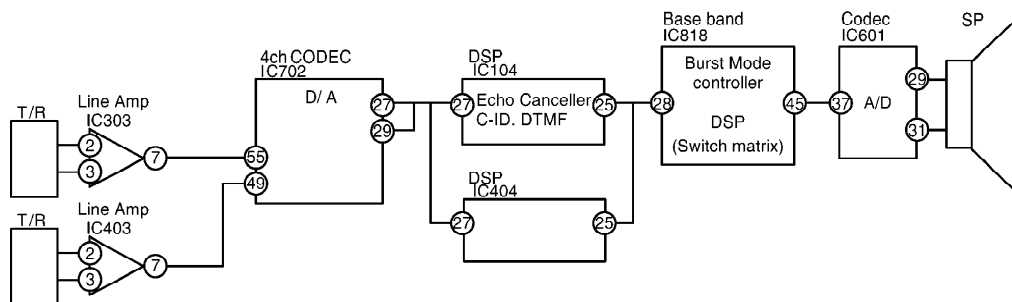

This circuit is used when the unit is used in the hands-free mode.

7.12.1. Reception signal path (In case of Line 1)

The input signal from the microphone is sent through the circuit via the following path: / T/R → pin2 and pin3 of IC403(differential) → pin64 of IC702 → pin27 of some one DSP IC104 and IC404 → pin28 of IC818 → pin37 of IC604 → SP

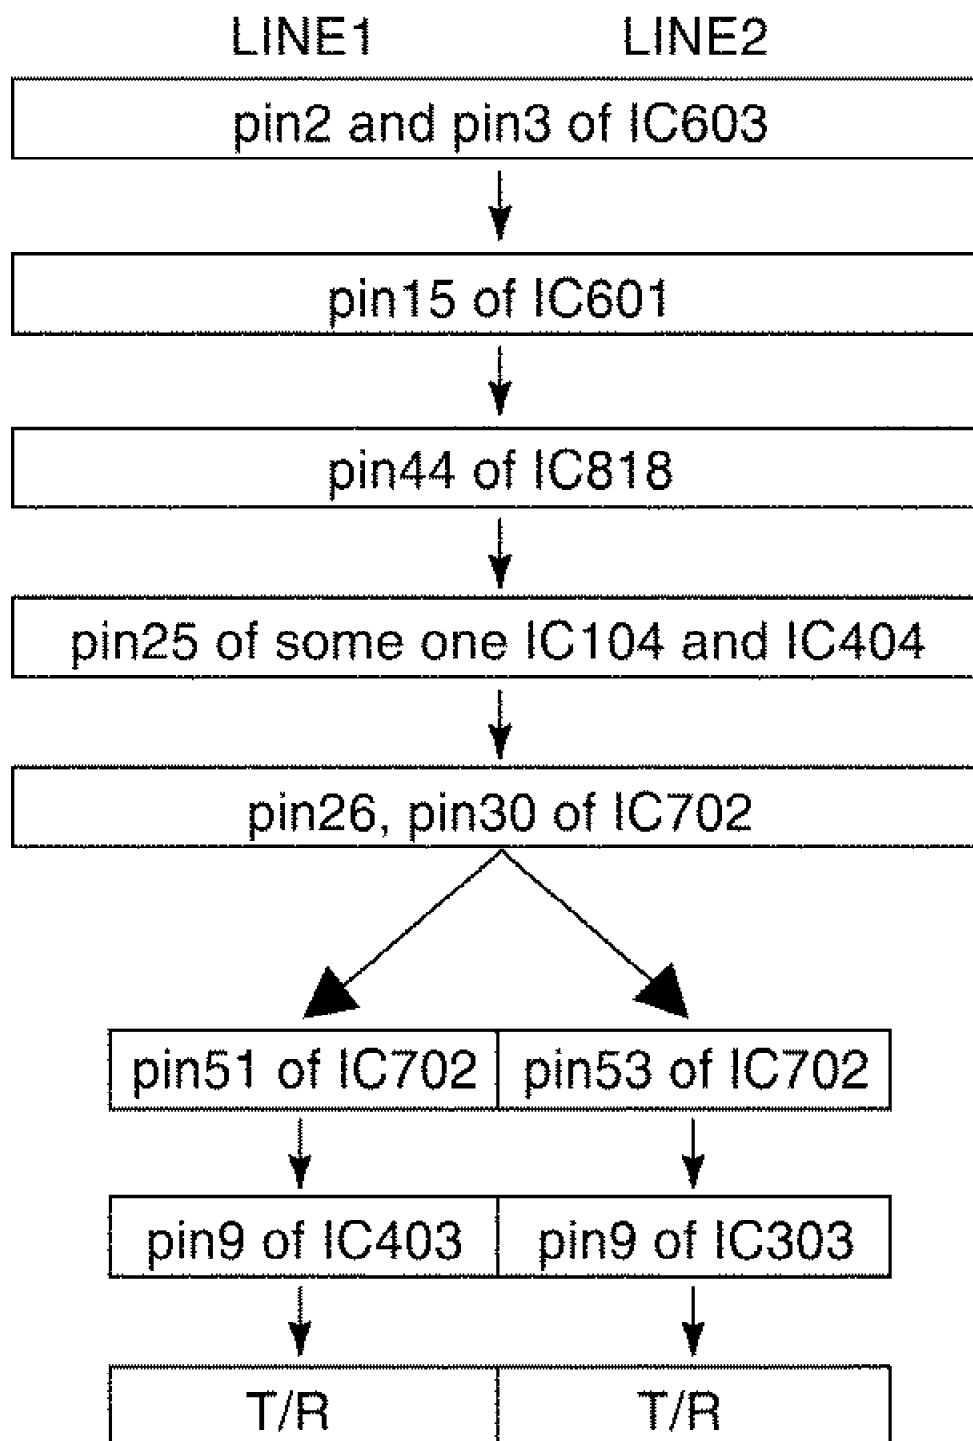

Speakerphone Mode

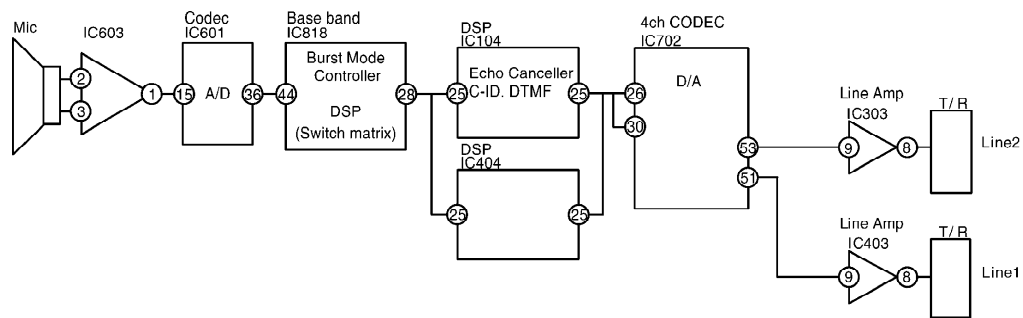

7.12.2. Transmission signal path (In case of Line1)

The input signal from the microphone is sent through the circuit via the following path: / Mic → pin2 and pin3 of IC603 (differential) → pin15 of IC601 → pin44 of IC818 → pin25 of some one DSP IC104 and IC404 → pin26 and pin30 of IC702 → pin9 of IC403 → Telephone Line

Speakerphone Mode

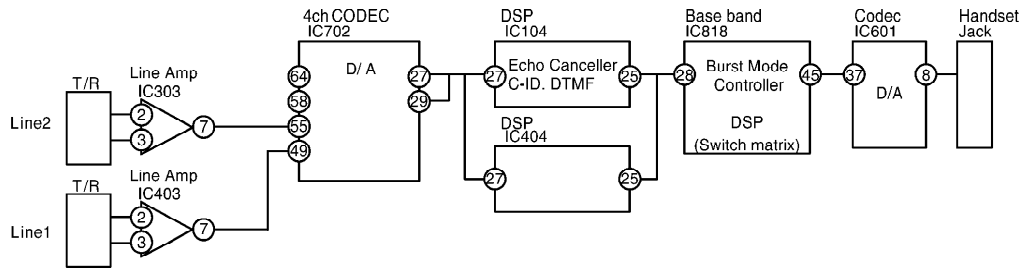

7.13. Handset Mode (Line Receiving)

7.13.1. Reception signal path

The audio signal from line transformer T301 - T401 is input to IC303 - IC403. IC303 - IC403 comprise line amplifier. These signals are output to pin55, 49 of IC702, according to Line2 - Line1. IC702 converts the signals into 8bit u-law data and sends to pin27 of IC104 and IC404. DSP IC104 and IC404 execute echo cancellation and DTMF reception for one channel each, and send the data to IC818. IC818 then sends the data to pin37 of IC601. IC601 converts the data into analog audio signal and sends to handset.

Handset Mode

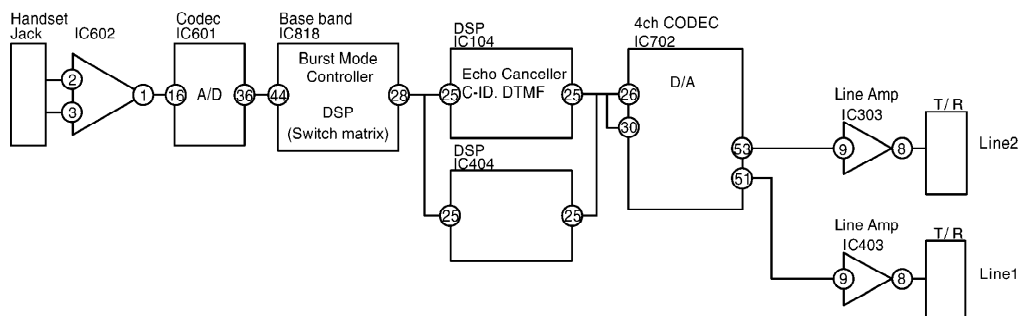

7.14. Handset Mode (Line Sending)

The audio signal and control data for 2 lines are sent by Time Division Duplex, sharing the same signal path.

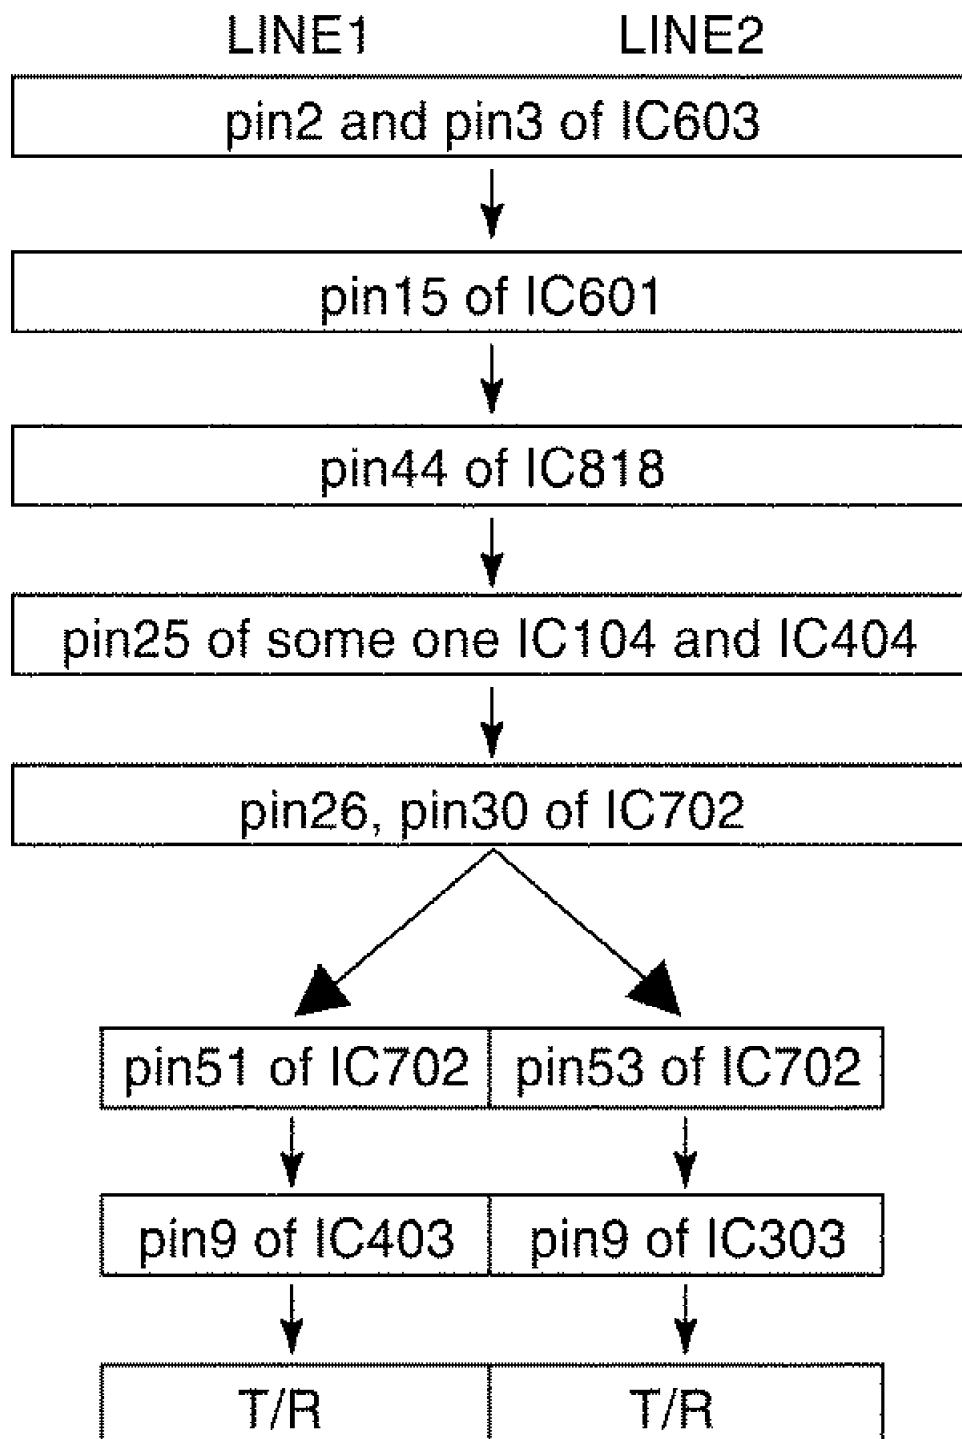

The analog audio signal of Handset Jack are input to pin2 and pin 3 of IC602, it comprises handset mic amplifier. IC601 converts the data to 8-bit u-law-encoded and sends to pin23 of IC818, then sends to pin25 of some one DSP IC104 and IC404. DSP IC104 and IC404 executes echo cancellation for Line1 - Line2 each.

Then the data is sent to pin26 and pin 30 of IC702. IC702 converts the data into analog audio signal and sends to pin9 of line amplifier IC303 - IC403. Then the signal is input to transformer T301 - T401.

Handset Mode

Transmission Signal Path

7.15. Intercom Mode

When the set is in Intercom Mode, the input signal from the microphone is sent through the circuit via the following path: Mic → pin2 and pin3 of IC603(differential) → pin15 of IC601 → pin44 of IC818 → RF Unit

The audio signal from Mic is input to IC603. IC603 comprise Mic amplifier

This signal is input to pin15 of IC601.

IC601 converts the signal into 8bit u-law data and sends to pin44 of IC818.

IC818 converts the data into digital TX data of ADPCM, then sends to pin22 of RF Unit.

Intercom Mode

The signal from the RF Unit is sent through the circuit via the following path: / RF Unit → pin78 and pin66 of IC818 → pin37 of IC601 → SP

The digital RX data of ADPCM and its inverted data from pin7 and pin8 of RF Unit are input to pin78 and pin 66 of IC818. IC818 converts the data to 8-bit u-law-encoded and send to pin37 of Codec IC601. IC601 converts the data into analog audio signal and sends to Speaker.

Intercom Mode

7.16. CHARGE CIRCUIT

The backup-battery is provided to cope with AC adaptor power failure. The voltage from the AC adaptor is supplied to the backup-battery through Q525, Q509 and Q503. They comprises constant current circuit to prevent from flowing too much current.

While Q526 is OFF, IC805 checks pin84 to monitor the battery's voltage and the battery's existence.

IC805 fluctuates pin89 periodically to switch Q526, so that it controls the charge current.

Ordinarily the mode is in trickle charge (18mA) to prevent overcharging. Once the backup-battery is used, normal charge (50mA) is started soon after the AC power recovers, then it changes to trickle charge.

In order to control the current, pin89 of IC805 fluctuates and Q526 and Q503 repeats ON/OFF, so that the current is reduced. When in trickle mode, the period that Q526 is OFF becomes longer, so that the average current is reduced. When in normal mode, the period that Q526 is OFF becomes shorter.

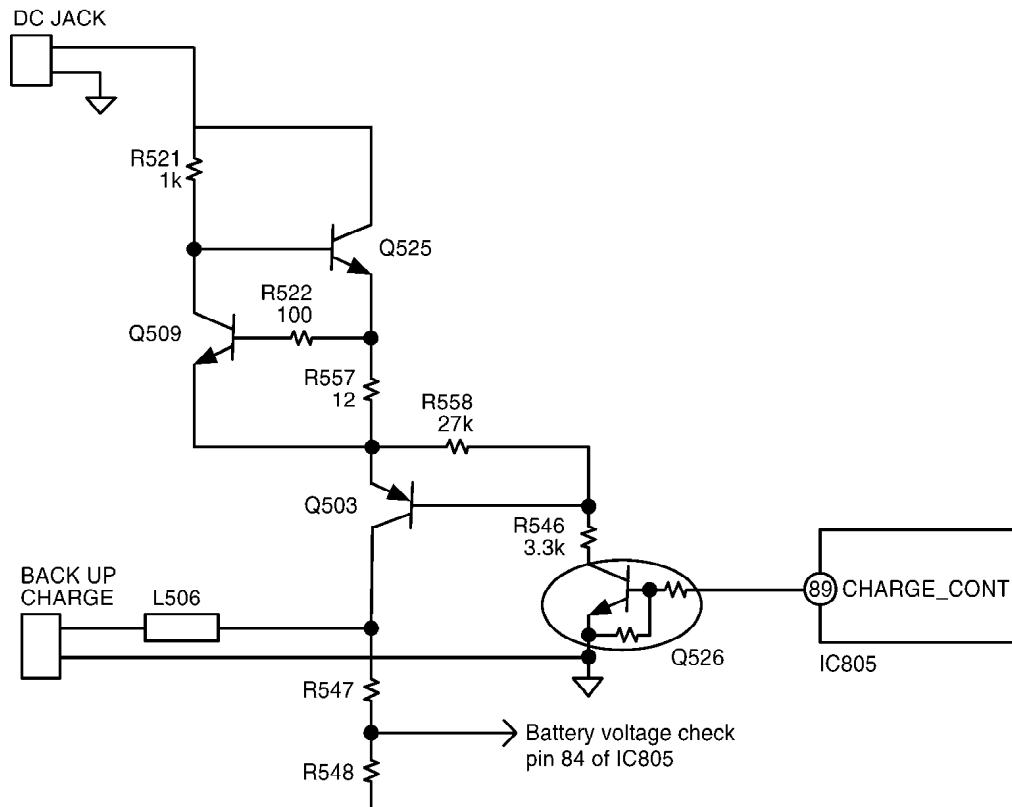

Power failure operation circuit

When AC power failures, the voltage at pin56 of IC805 becomes low. In case that the battery is

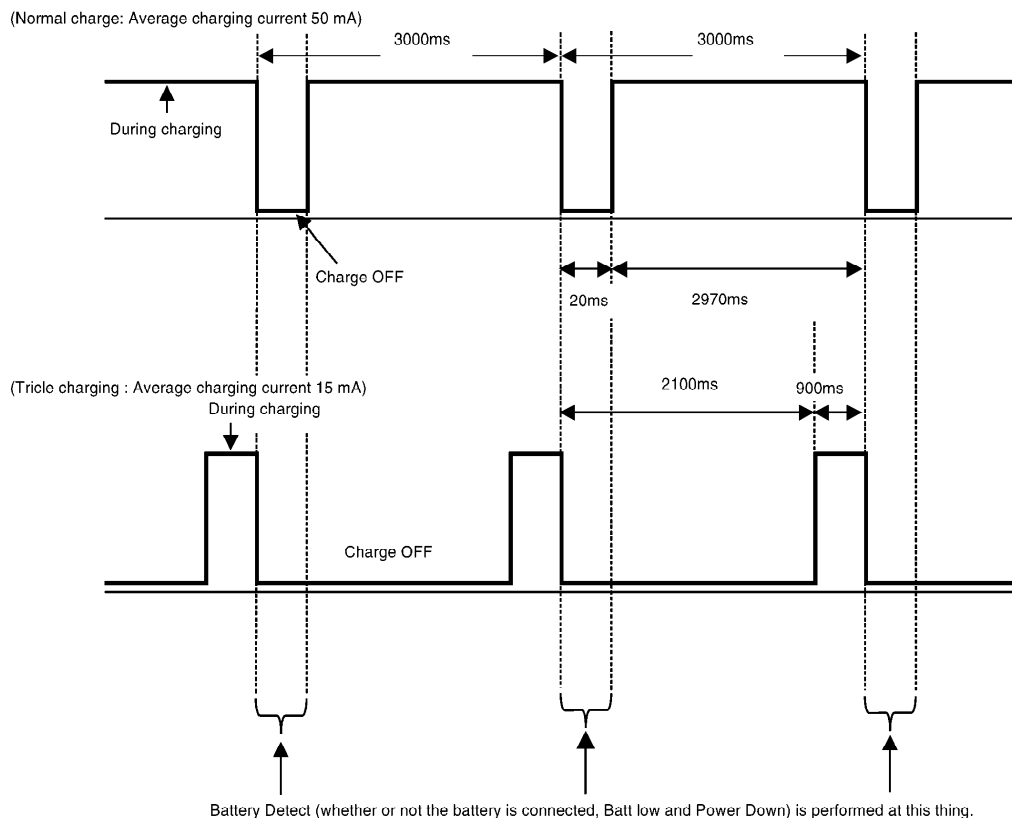

connected, IC805 immediately (within 2ms) turns pin55 high to turn Q524, Q516 and Q514 ON, so that the current from backup-battery is fed instead of AC power to each block. This makes Q505 and Q504 not to send STOP signal, resulting IC805 operation continue.

In case that the battery is NOT connected and AC power failures, the voltage at pin56 becomes low but IC805 keeps pin55 low to maintain Q524, Q516 and Q514 OFF, so that the current to each block is stopped. So, Q505 and Q504 sends STOP signal, resulting IC805's operation stop. According to the battery's voltage appeared at IC805 pin84, the output from IC805 changes so that battery's status is shown by Backup LED Q909.

battery	AC power	battery's voltage	backup LED	status
exists	alive	-----	lights	battery exists (operational at power failure)
exists	failure	high	lights	power failure but operational
exists	failure	low	flashes	battery low
exists	failure	lower	lights out	NO power failure operation
none	alive	-----	lights out	NO power failure operation

7.16.1. Charge Control

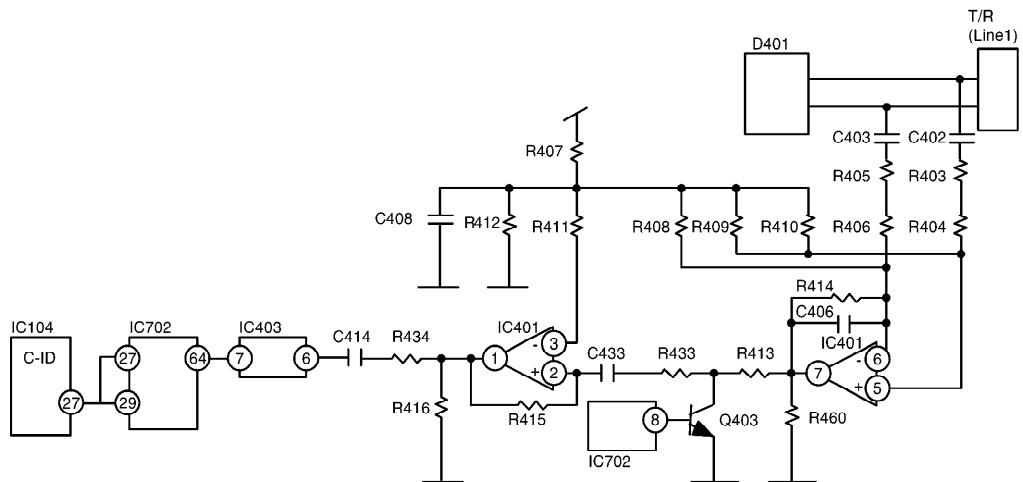

7.17. Calling Line Identification Circuit (Caller ID)

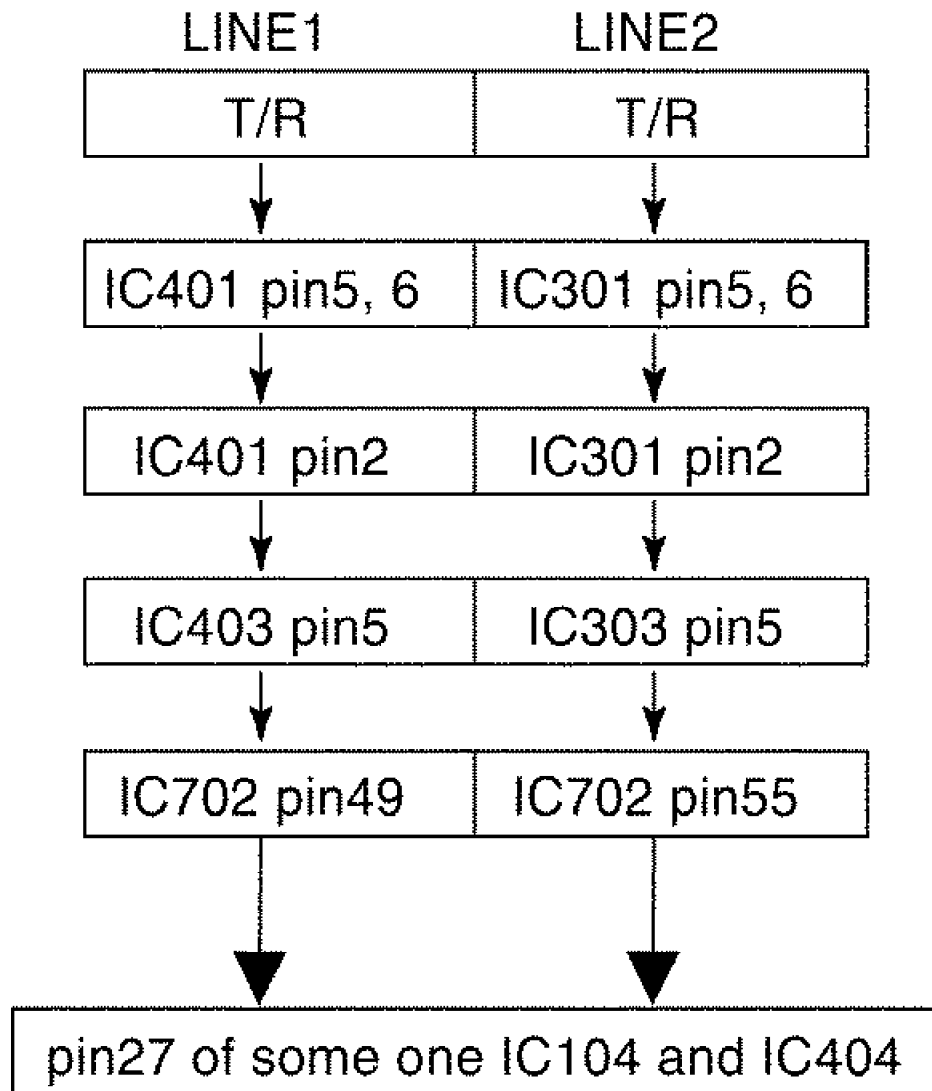

The caller ID is a chargeable ID which the user of a telephone circuit obtains by entering a contract with the telephone company to utilize a caller ID service. For this reason, the operation of this circuit assumes that a caller ID service contract has been entered for the circuit being used. The data for the caller ID from the telephone exchange is sent during the interval between the first and second rings of the bell signal. The data from the telephone exchange is a modem signal which is modulated in an FSK (Frequency Shift Keying) format. The data from the telephone exchange is a modem signal which is modulated in an FSK (Frequency Shift Keying) format. Data "0" is a 1200Hz sine wave, and data "1" is a 2200Hz sine wave. There are two types of the message format which can be achieved: i.e. The single message format and plural message format. The plural message format allows to transmit the name and data code information in addition to the time and telephone number data.

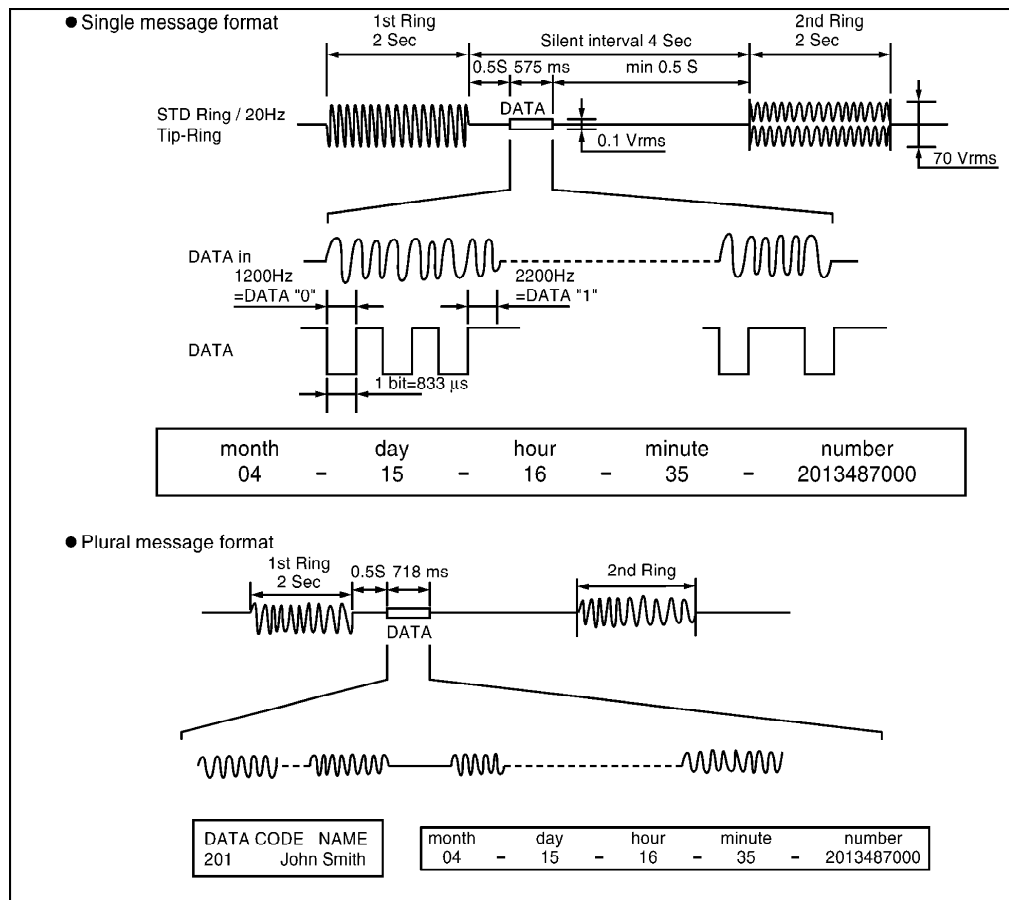

Call IC path:

As for Line 4, the Call ID signal flows from T/R → IC401 5, 6pin → IC401 2pin → IC403 6pin → IC702 64pin → IC104 27pin

Call-ID Signal path

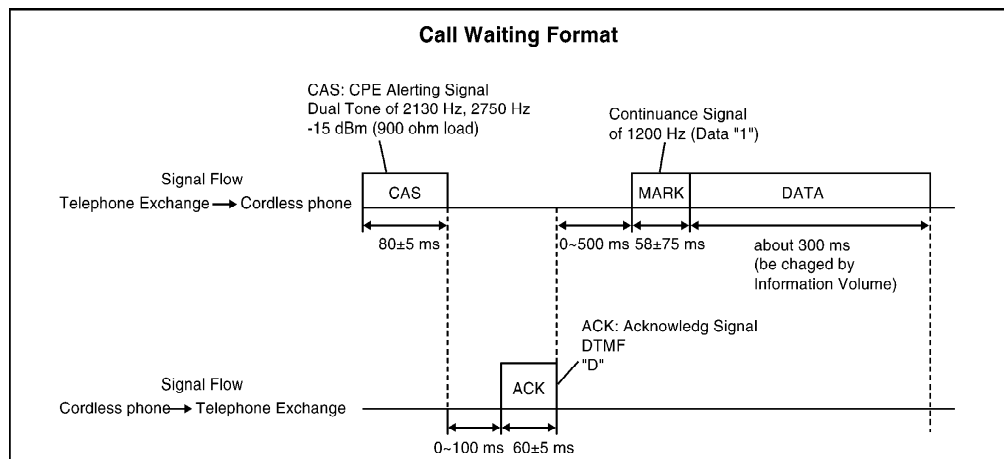

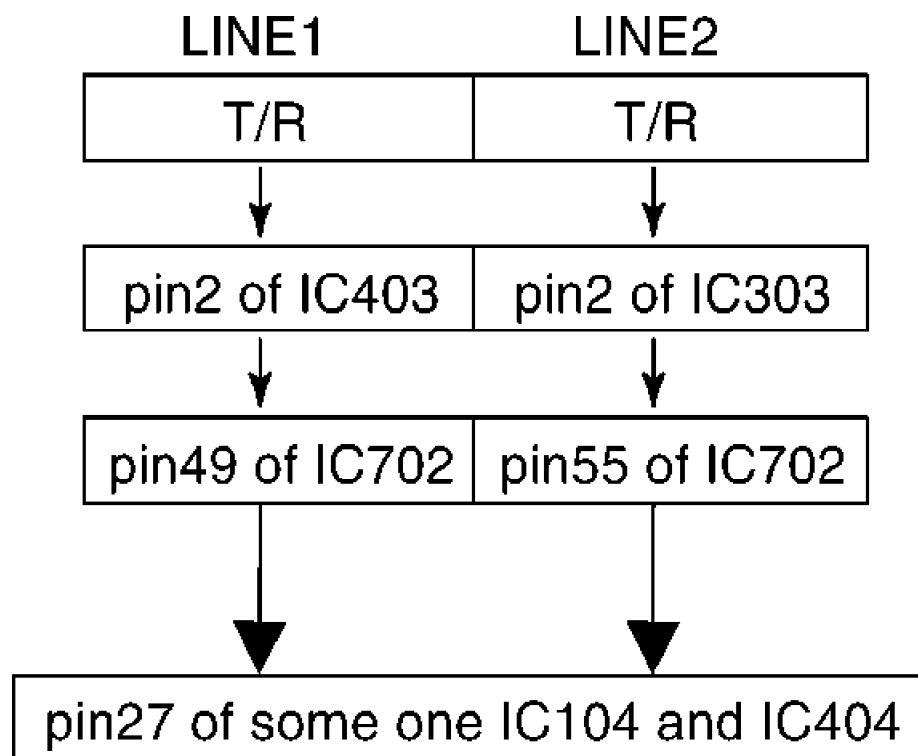

7.18. Call Waiting

Calling Identity Delivery on Call Waiting (CIDCW) is a CLASS service that allows a customer, while off-hook on an existing call, to receive information about another calling party. The transmission of the calling information takes place almost immediately after the customer is alerted to the new call so the person can use this information to decide whether to take the new call.

As for Line 1, the CAS signal flows from T/R → T401 → IC403 → IC702 64pin (same to voice signal path), and the ACK (DTMF signal) is returned to the telephone exchange. The telephone exchange that received the ACK can send the data in the same manner as the caller ID. If the telephone deems that a telephone connected in parallel is in use, ACK is not returned even if CAS is received, and the information for the second and subsequent callers are not displayed on the display.

Call waiting Signal path

7.19. Parallel Connection Detection Circuit

In order to disable call waiting functions when using telephones connected in parallel, a circuit that determines whether a telephone connected in parallel is in use or is not. This circuit determines whether the telephone connected in parallel is on hook by detecting changes in the T/R voltages.

Circuit Operation

Detection of parallel connection in on-hook conditon.

When on hook, the voltage at pin81,82 of IC805 is monitored. There is no parallel connection if

the voltage is 1.8V or higher, while a parallel connection is detected to exist the telephone connected in parallel in OFF-HOOK condition if the voltage is lower.

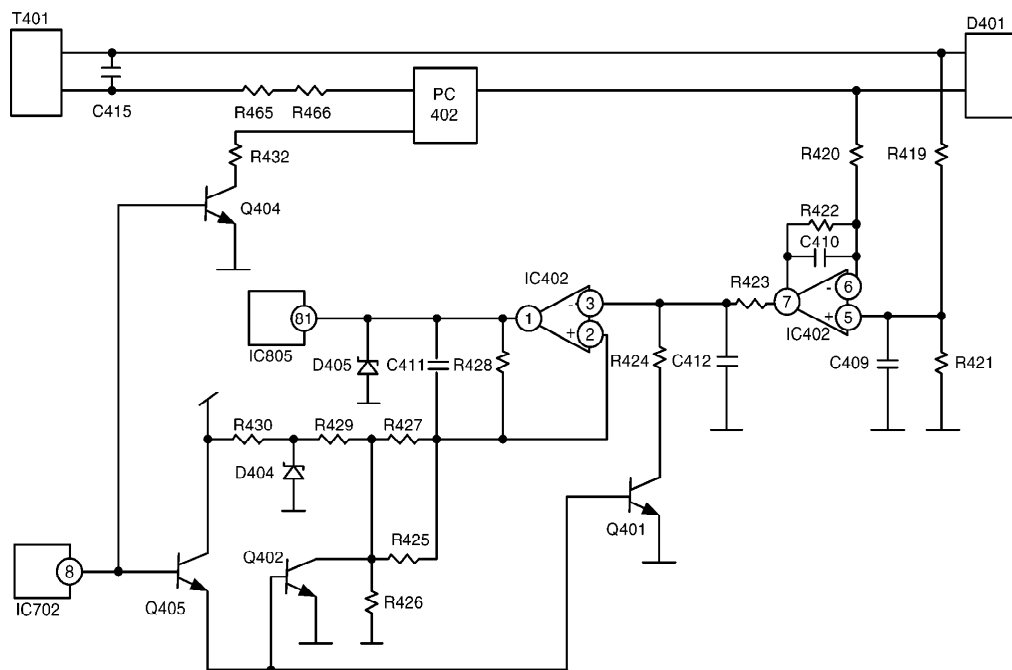

Detection of parallel connection on OFF-HOOK condition

When off hook, the voltage at pin81,82 of IC805 is monitored; the presence/absence of a parallel connection is determined when the voltage changes by 0.1V or more.

CPC Detection

When the TAM receives a call, the unit becomes ON-HOOK if receiving the CPC signal which is output from the exchanger after the other party's TEL line is disconnected.

The line monitoring starts as soon as the TAM receives a call. If the voltage of the IN USE detection circuit at pins 81,82 of IC805 has been 0.1 V or below for 360 ms or more, the unit judges that the CPC signal is detected then the line is disconnected automatically.

Parallel Detection path

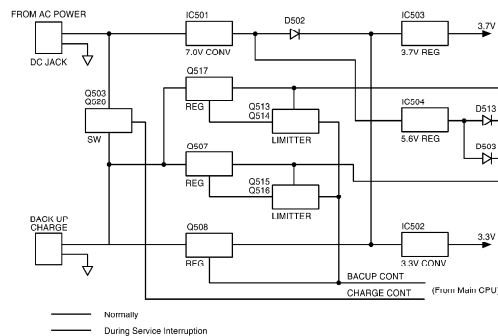

STOP

When the AC power is installed, the circuit consisting of IC819 outputs low signal until the 3.3V power from IC502 exceeds 2.7V. While this remains low, CPU IC805 stops its oscillation.

Fluctuation of Power Source

		AC Power Source (V)			Vbat (V) During Service Interruption Operation				Remarks
Power Source	Point of Measurement	102	120	138	6.0	6.6	7.2	8.4	
7V Reg	0502 IN	6.88	6.82	6.82	-	-	-	-	Not Operate during Service Interruption

Reference

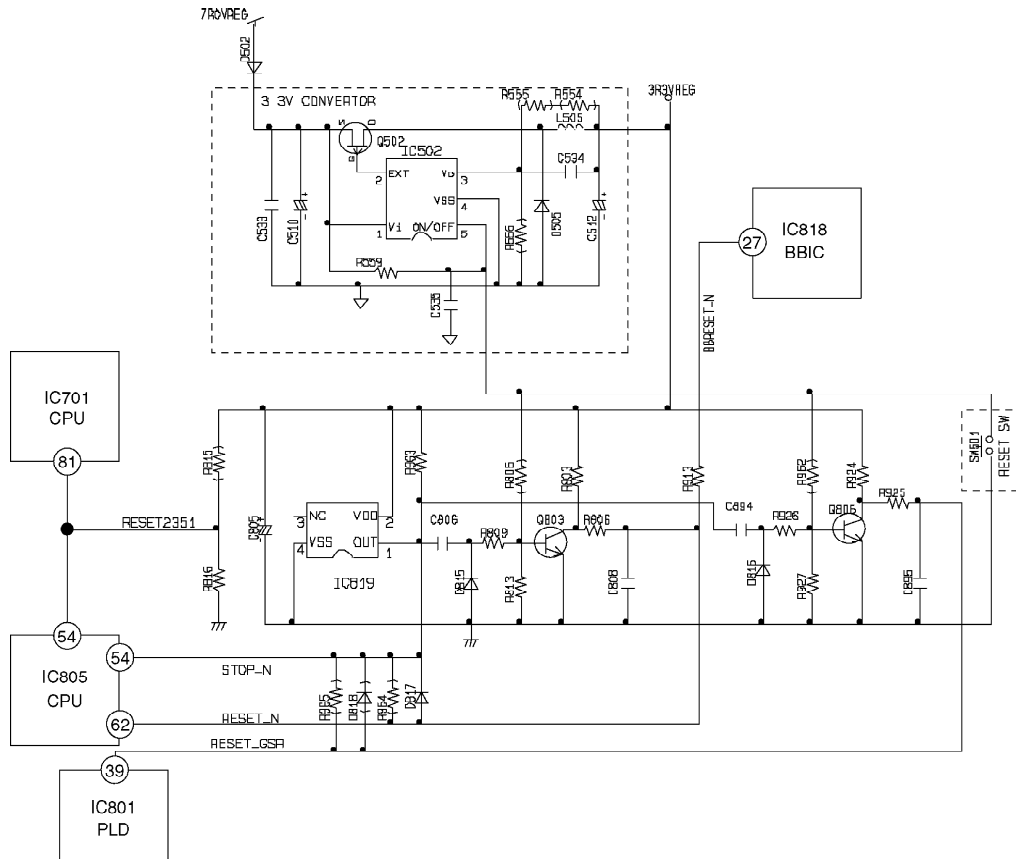

Reset

When the AC power is installed, the reset circuit consisting of IC819, Q803 and Q806 outputs low signal to pin62 of CPU IC805, pin 27 of IC818 and pin 39 of IC801. After about 20ms, pin39 of IC801 becomes high first.

Then after 20ms later from pin39 of IC801, pin62 of IC805 and pin27 of IC818 become high. When the signal change from low to high, these 3 IC are reset and initialized. Pin 54 of IC805 remains low until its software has started, A reset signal to pin81 of Sub CPU IC 701 is at least 500 μ s second. When a reset signal ia raised and the clock output from pin 69 of IC805 to pin85 of IC701 is stable, the software of Sub CPU IC701 is started. After pressing reset switch, adjustment of time and date needs. When base unit is working by only back-up battery, if reset switch is pressed, CPU stops working. Because base unit starts working by AC power in initial use.

AC power down

When the AC power failure happens, the output from Q505 to pin56 of IC805 and pin 112 of IC701 goes low. Then MAIN CPU IC805 and Sub CPU IC701 starts power down operation.

Reset Switch

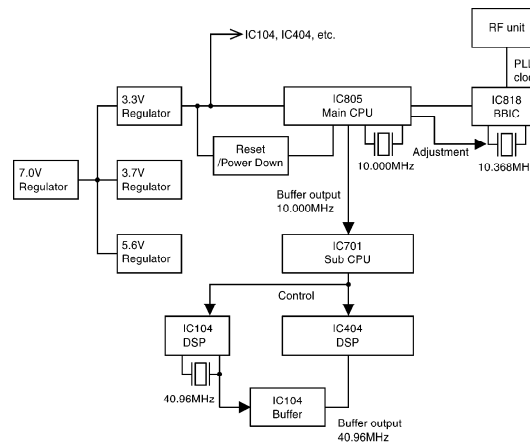

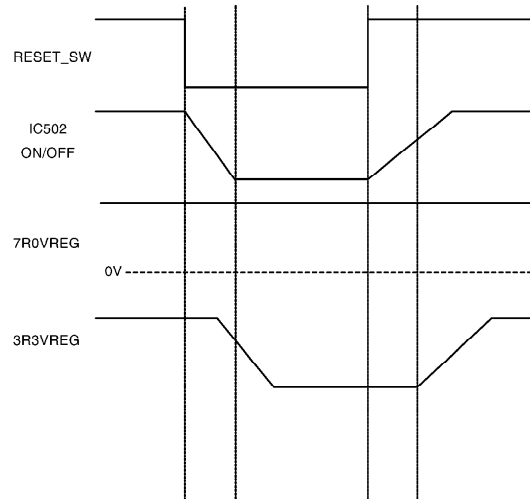

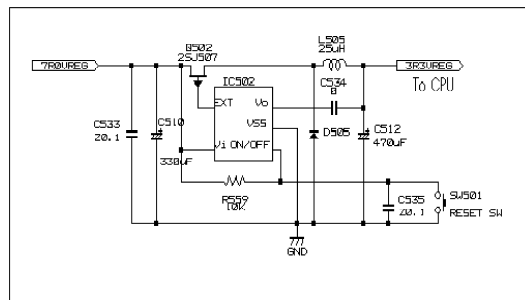

Reset switch is final method to recover Base Unit when it doesn't work.

Regulator of 3.3V (IC502: for power supply of CPU) turns off while the switch is pressed.

After release the switch, Base Unit starts again and be initialized.

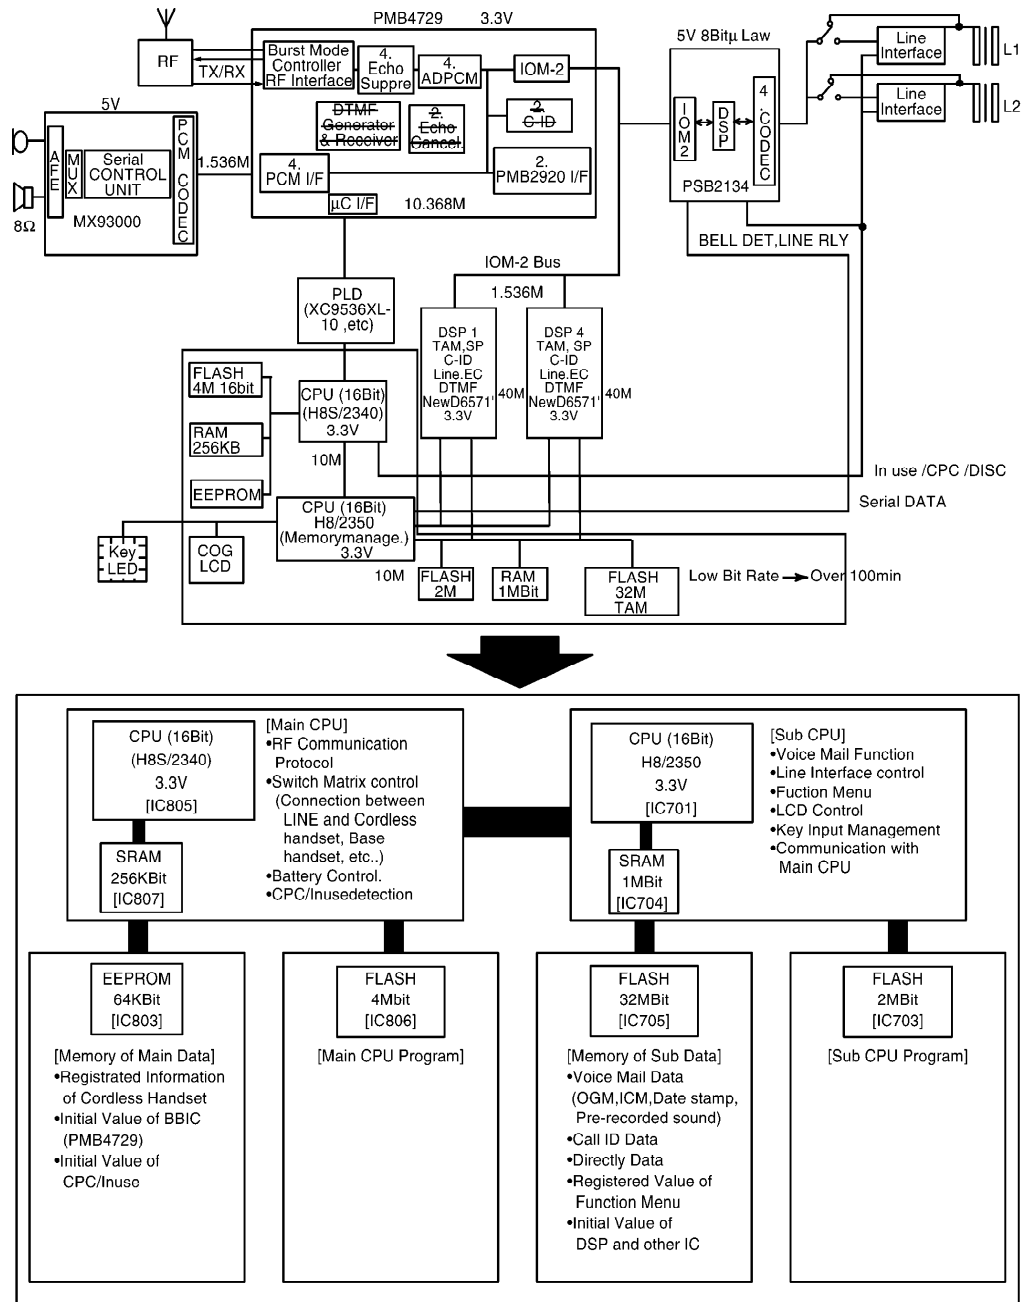

Base Unit forgets date and time, but the other data are remaining.

After pressing switch, adjustment of time and date needs. When base unit is working by only back-up battery, if reset switch is pressed, CPU stops working. Because base unit starts working by AC power in initial use.

7.20. Memory

Base unit has 4 Memory IC, CPU for Main and CPU for Sub. Role of each IC are follows.

8. CIRCUIT OPERATION (CORDLESS HANDSET)

8.1. Power Supply Circuit

The circuit diagram below shows the block for activation control of the 1 chip IC of the cordless handset, and the power source circuit.

The cordless handset is automatically switched ON if a high pulse or high signal is input to the ON port (pin 110 of IC1) or the CDT port (pin 111 of IC1). Then, if VDDB (pin 109 of IC1) is 2.0 V or more, the DCDC converter is activated. And when the LRSense port (pin 120 of IC1) reaches 2.65 V -10%, internal RESET is input to the analog block and digital block, so all circuits are activated.

DCDC Converter

This is comprised of Q6, L1, R63, R64, D20, C27, C26, EXTR (pin 114 of IC1), CMR (pin 116 of IC1), and DCSENSE (pin 118 of IC1). With a standard input of 2.4 V, an output voltage of 3.8 V is generated.

EXTR (pin 114 of IC1) is the port for Q6 control, and DCSENSE (pin 118 of IC1) is the standard input port of the DCDC converter. CMR (pin 116 of IC1) is the port for L1 current control. It uses R64/0.1 Ω to limit the current to 1.9 A.

Regulator

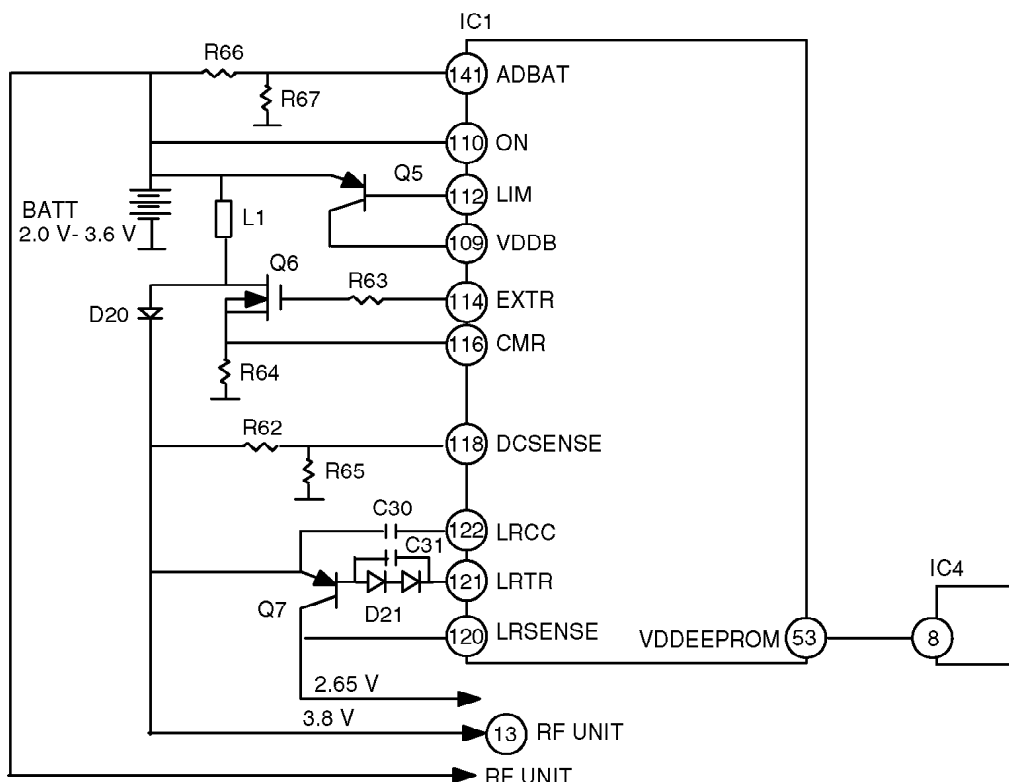

This is comprised of Q7, D21, C31, C34, C35 and LRTR (pin 121 of IC1), LRCC (pin 122 of IC1) LRSENSE (pin 120 of IC1). Input of 3.8 V is regulated to 2.65 V.

LRTR (pin 121 of IC1) is the port for Q7 control, LRCC (pin 122 of IC1) is the port for AC input to the regulator, and LRSENSE (pin 120 of IC1) is the standard input port.

LIM (pin 112 of IC1) is the port for battery limiter control. It is this port which controls Q5 and controls input to VDDDB (pin 109 of IC1).

ADBAT (pin 141 of IC1) is the port that monitors the battery voltage. It detects battery LOW if the voltage is 2.35 V or less.

VDD EEPROM (pin 53 of IC1) is the power output port for the external EEPROM.

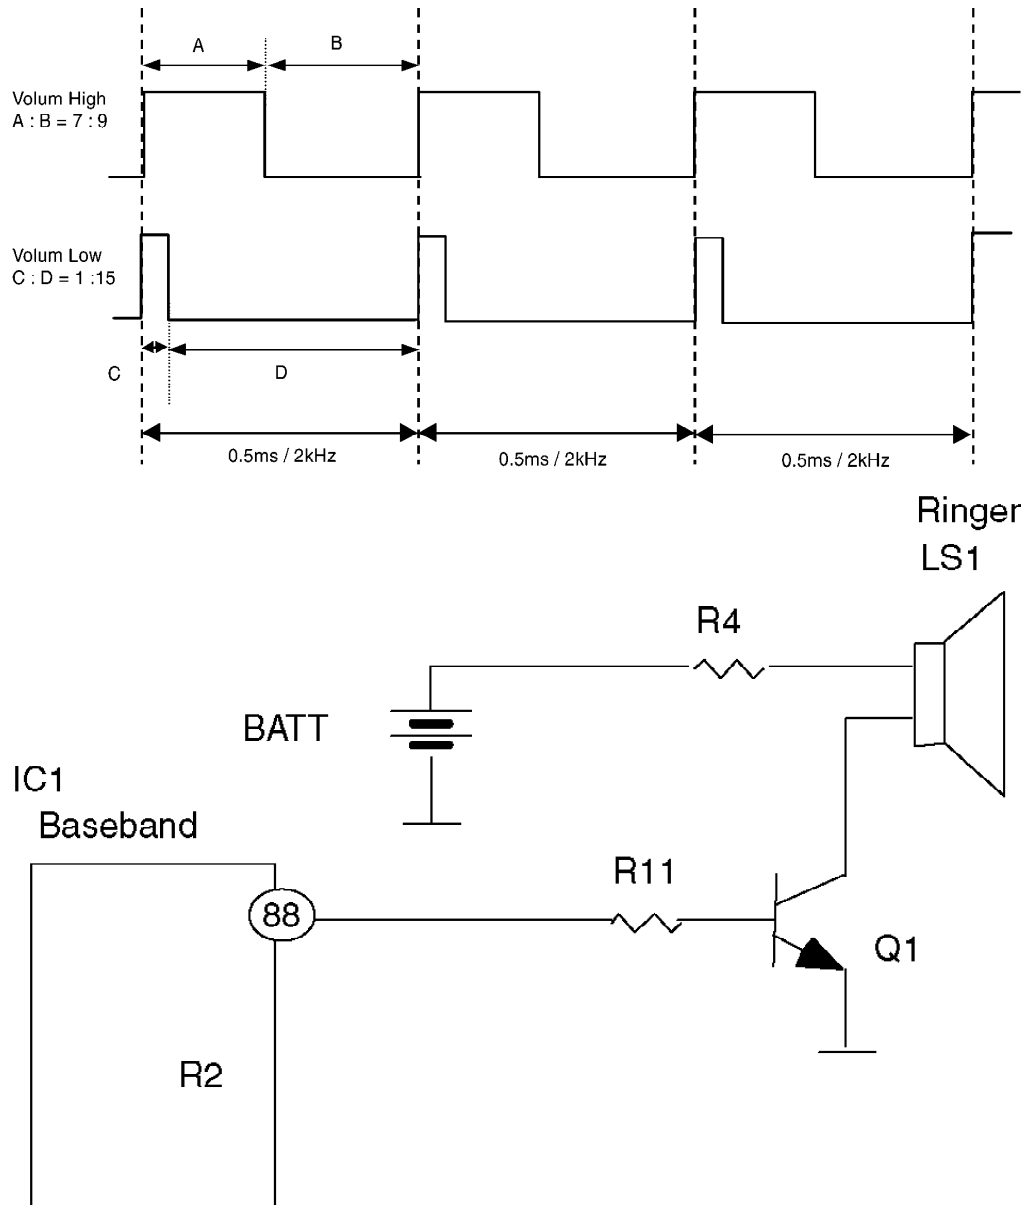

The power for sounding from ringer is supplied from Battery.

The signal for driving the ringer is supplied from pin88 of Baseband IC1, and turns Q1 ON and OFF.

The ringer volume is controlled by the Pulse Width of the signal.

The ringer volume can be switched between HIGH and LOW. The volume is controlled by

changing the duty ratio of the signal output from pin 88 of IC1.

8.2. Sending Signal Circuit

When selected TALK key, Cordless handset go into TALK mode. / The audio signal from microphone is inputted to pin 134 and pin 137 of IC1 with Balance. / In the IC1 the audio signal is coded to Linear-PCM signal and also companded to LOG-PCM signal in DSP block. The LOG-PCM signal goes from DSP block to BMC block is transcoded to ADPCM Signal and formed TX data.

The TX data goes out from pin 17 of IC1 is inputted to pin 22 of RF unit. The modulated signal goes out from RF unit to antenna.

Transmission Signal

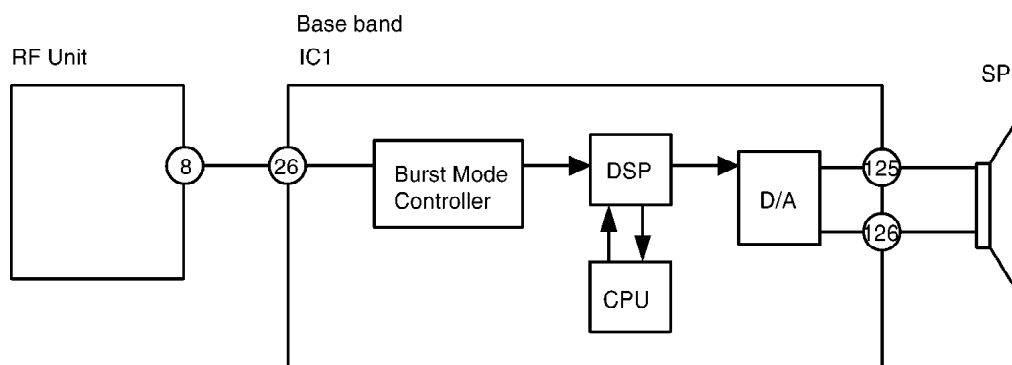

8.3. Reception Signal Circuit

A signal is received by antenna is inputted to RF unit. / In the RF unit the received signal is demodulated and shaped digital base band signal. ADPCM transcoder of IC1. / The digital base band signal goes from pin 8 of RF unit is inputted to pin 26 of IC1.

In the IC1, BMC block pick up ADPCM signal from digital base band signal and pass to the ADPCM transcoder of IC1. / In the ADPCM transcoder the incoming ADPCM signal is transcoded to LOG-PCM signal, u-law.

The LOG-PCM signal goes from BMC block to DSP block is expanded to Linear-PCM and decoded to audio signal. / The audio signal goes from pin 125 and pin 126 with balance to speaker.

Reception Signal

8.4. Reset

Reset occurs under the following conditions.

1. When the battery voltage is 2.2 V or more and the battery is inserted.
2. When the battery is recharged.

At the start of charging the battery voltage is 2.2 V or less and operation does not start, but operation starts when the voltage increases to 2.2 V or more.

* The reset signal is not output when battery voltage increases gradually.

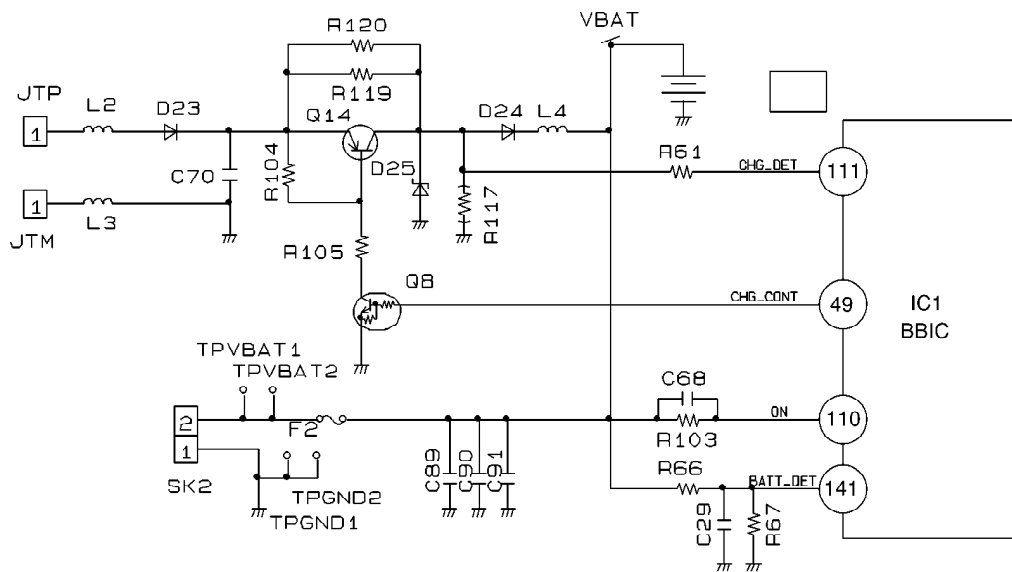

8.5. Battery Low

If the battery voltage reaches to about 2.37 V, battery low condition is detected at ADBAT and Battery LOW is displayed.

Power Down Detection and STOP Mode Conditions

When ADBAT detects that the battery voltage is 2.2 V, IC1 switches to STOP mode.

8.6. Headset Detect

The headset detection circuit is shown below. This circuit enables detection of the status of normal cordless handset communication and headset communication, and switching between them.

When the cordless handset is used, MIC bias from pin 133 of IC1 is applied and voltage is applied to MICI by the following route: R2 → R1 → pin 2 of J3 → pin 3 of J3 → MIC_P. This voltage turns Q17 ON so that LOW is input into pin 143 of IC1. When using the headset, plugging in the headset disconnects pin 2 and pin 3 of J3, resulting in Q17 turning OFF and HIGH being input to pin 143 of IC1. By this method, it can be detected whether or not the headset is present.

8.7. Charge Circuit

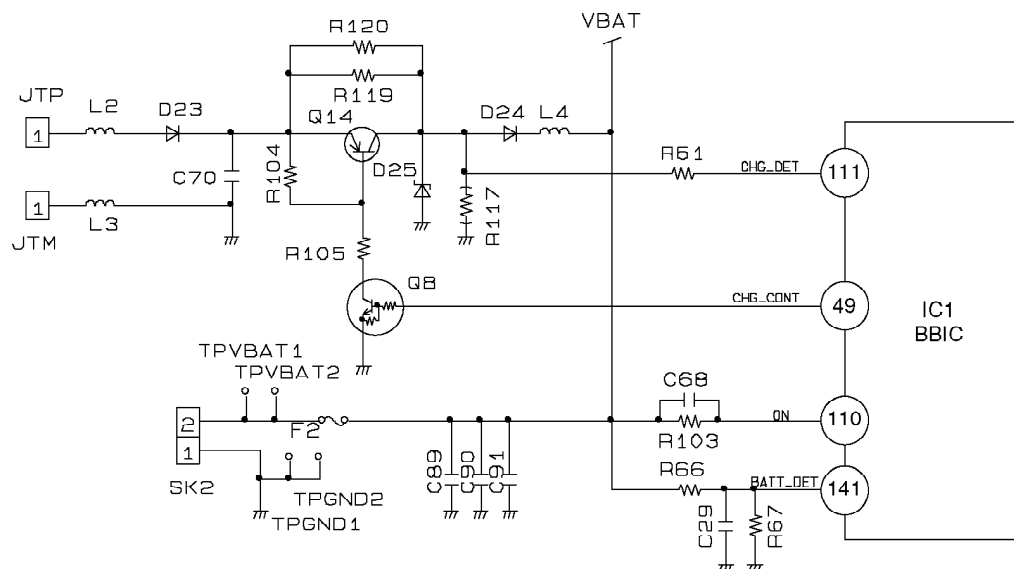

The circuit shown below is used for charge detection, charge control and battery voltage detection.

When charging is performed using the charger, voltage is generated between JTP and JTM, and voltage flows $L2 \rightarrow D23 \rightarrow R120$ and $R119 \rightarrow R61 \rightarrow$ pin 111 of IC1, where the charge is detected. Then IC1 calculates the battery consumption amount from the previous charge, and it controls Q8 by pin 49 of IC1 until charging is complete. When charging is complete, charging is switched to trickle charging.

BATT_DET (pin 141 of IC1) monitors the battery voltage and detects BATT LOW at 2.37 V.

Charge current

Q8 OFF: 45mA / Q8 ON: 200mA

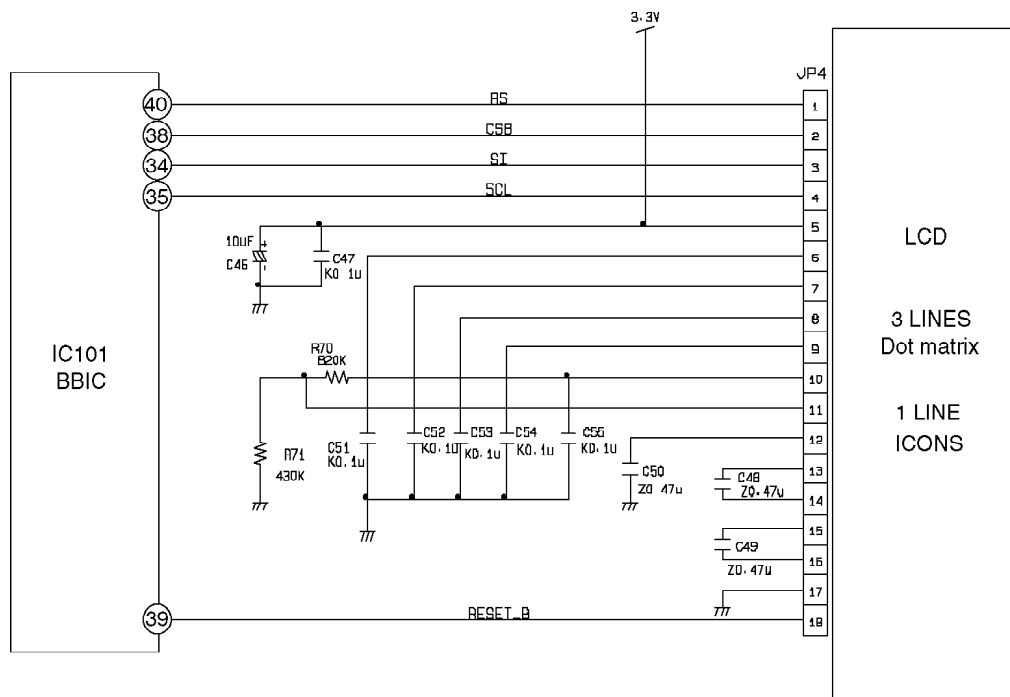

8.8. LCD Circuit

This LCD incorporating a COG IC uses one line for icon display and three lines for character display. / The COG LCD is controlled by 4 control lines (CSB, SCL, SI and RS) from IC1.

Power is only supplied by a 2.65 V system. The voltage is up converted inside the LCD and

output at pin 10. This voltage is divided by R70 and R71, and input to pin 11 to set the LCD contrast.

Data Waveform

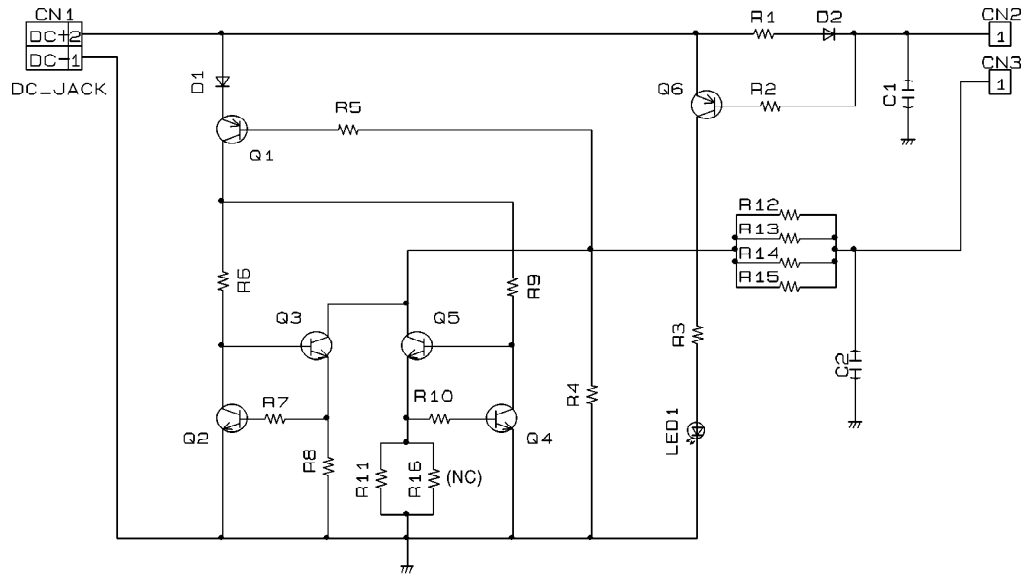

8.9. Charger

The battery charger circuit for the cordless handset is shown below.

When the cordless handset is placed on the charger, CN2 and CN3 are connected to the charger so the battery is connected. Current then flows to the battery to charge it.

The route for this is as follows: Pin of CN1 → R1 → D2 → CN2 → cordless handset → CN3 → R12 (0 Ω) → Q5 and Q3 → R8 and R11 → pin 1 of CN1.

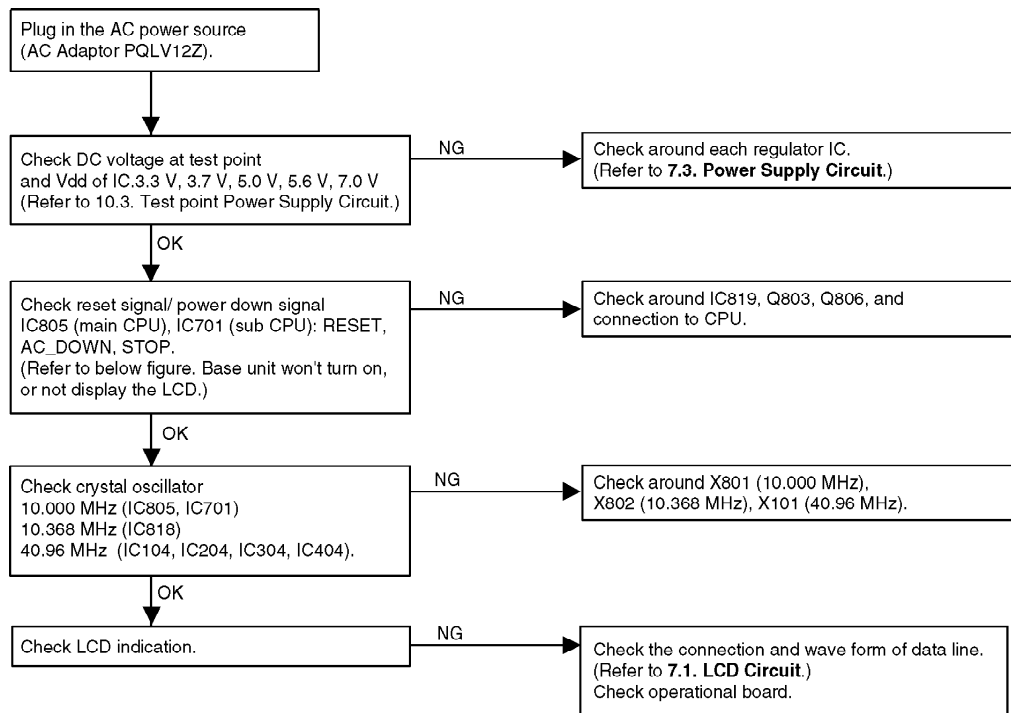

When cordless handset is charged, Q6 turns ON and LED 1 lights up. Q3, Q2 and Q5, Q4 become fixed current circuits, being divided into 2 circuits in order to reduce the current consumption per circuit.

9. TROUBLESHOOTING GUIDE

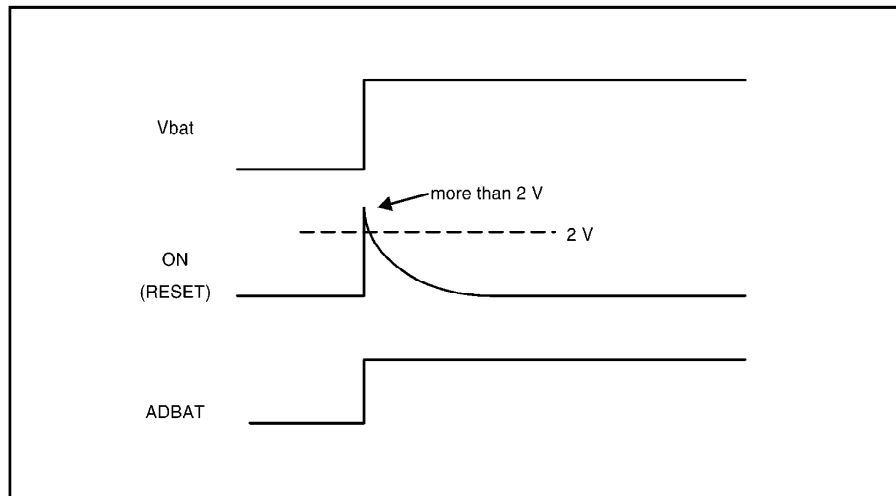

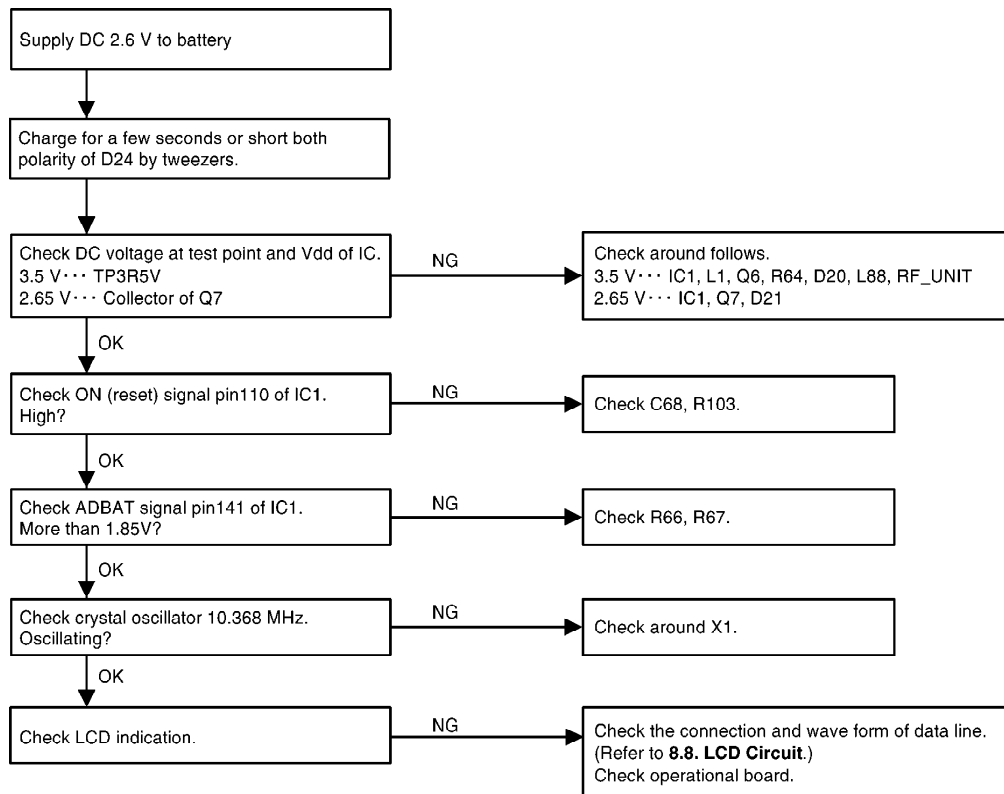

9.1. Initial Check

9.1.1. Base unit won't turn on, or not display the LCD

Timing logic of Vdd, RESET, STOP

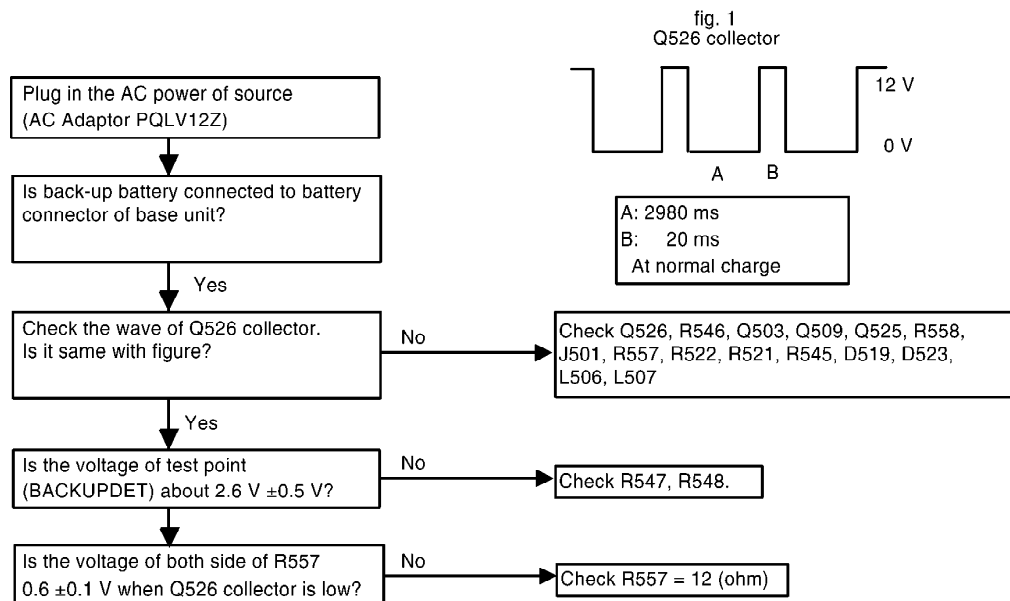

9.1.2. Cordless handset won't turn on, or not display the LCD

Timing logic of Vbat, ON (RESET), ADBAT

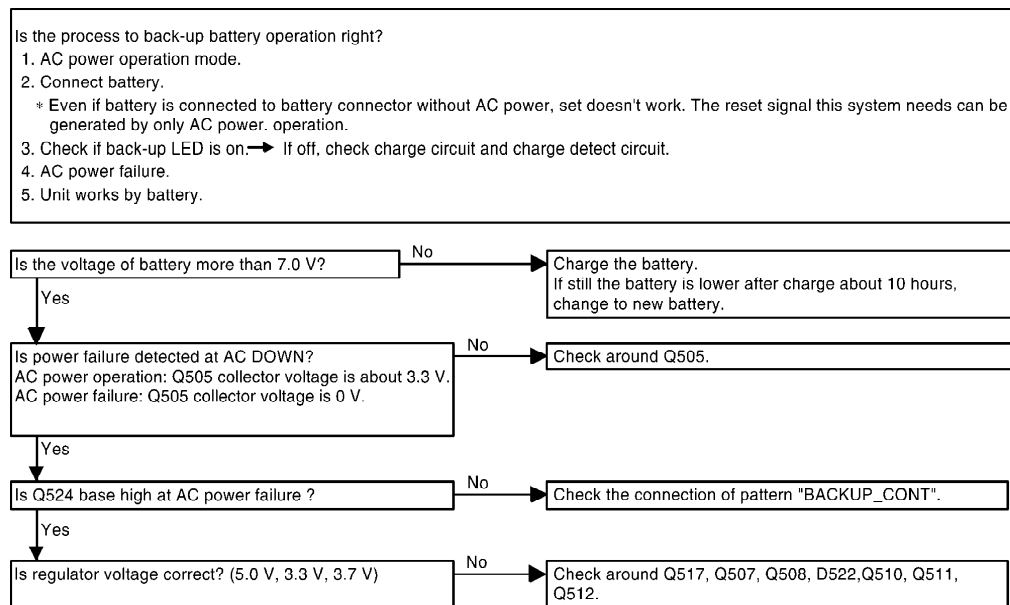

9.1.3. Battery won't charge (Base Unit)

Battery for back-up doesn't charge (Base unit)

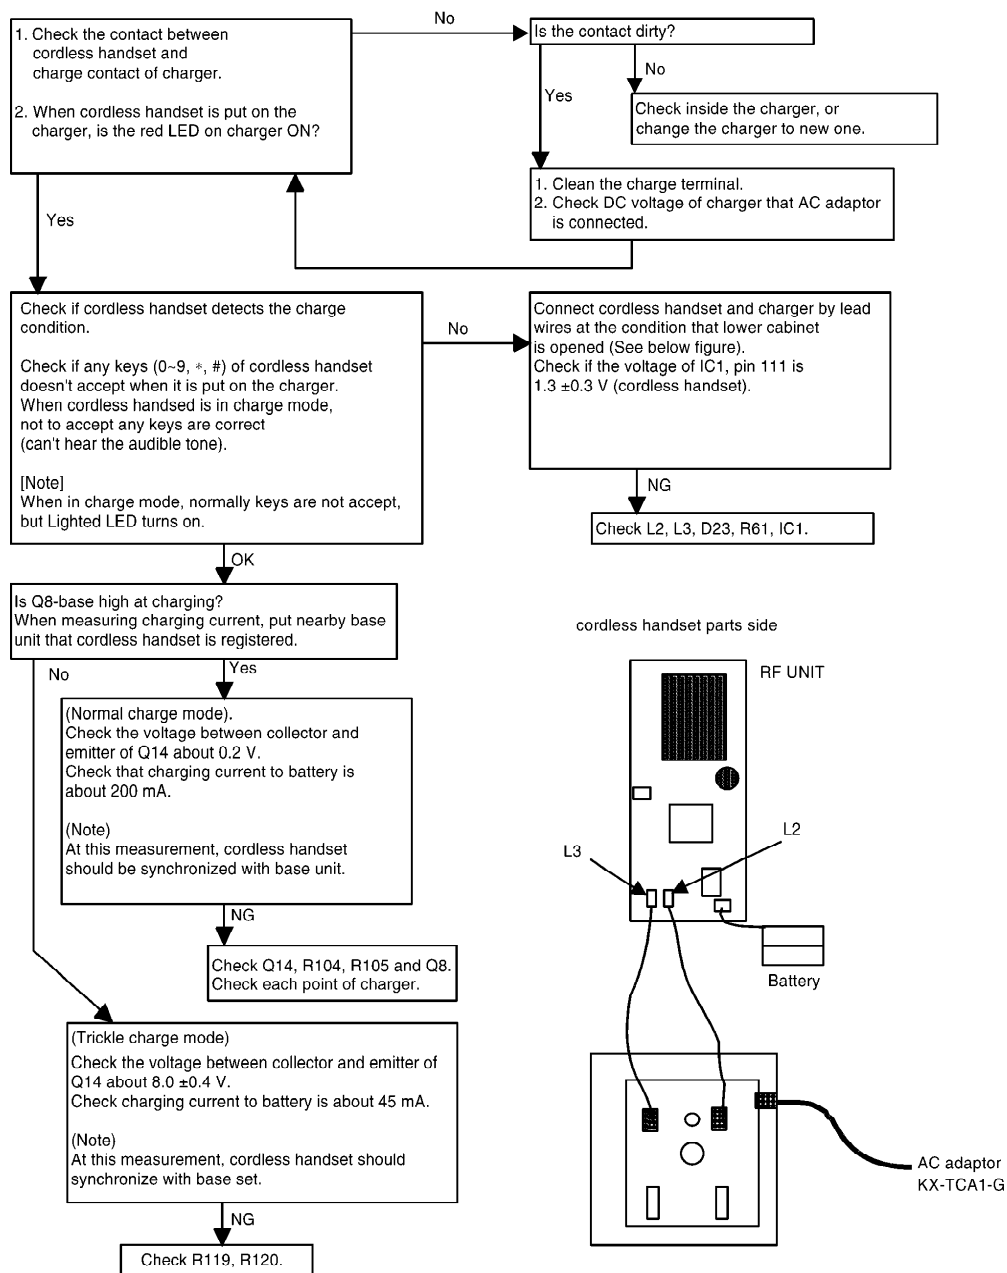

9.1.4. No work at Power failure

Base unit doesn't work at AC power failure.

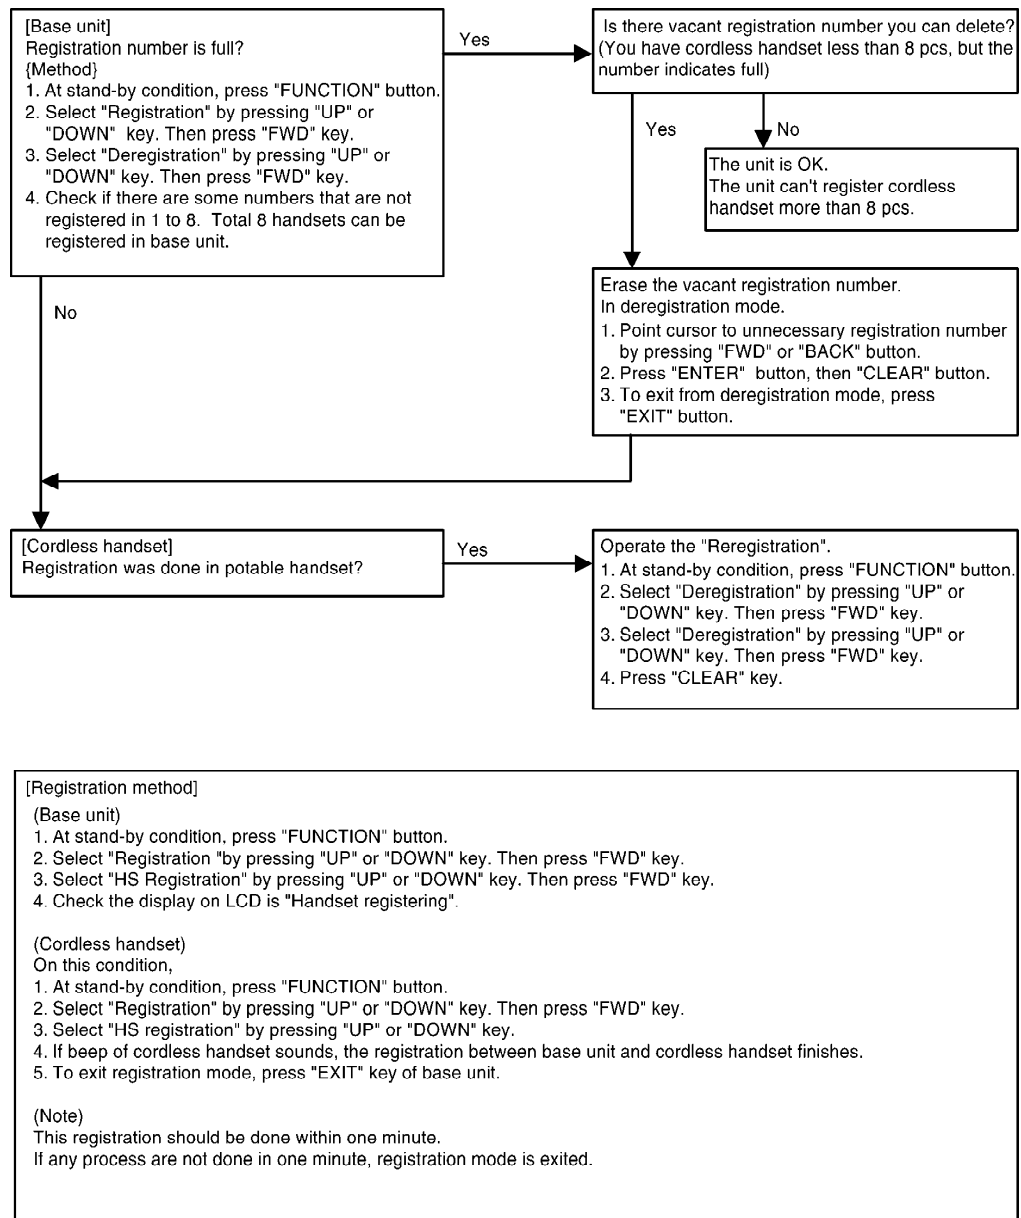

9.1.5. Battery won't charge (cordless handset)

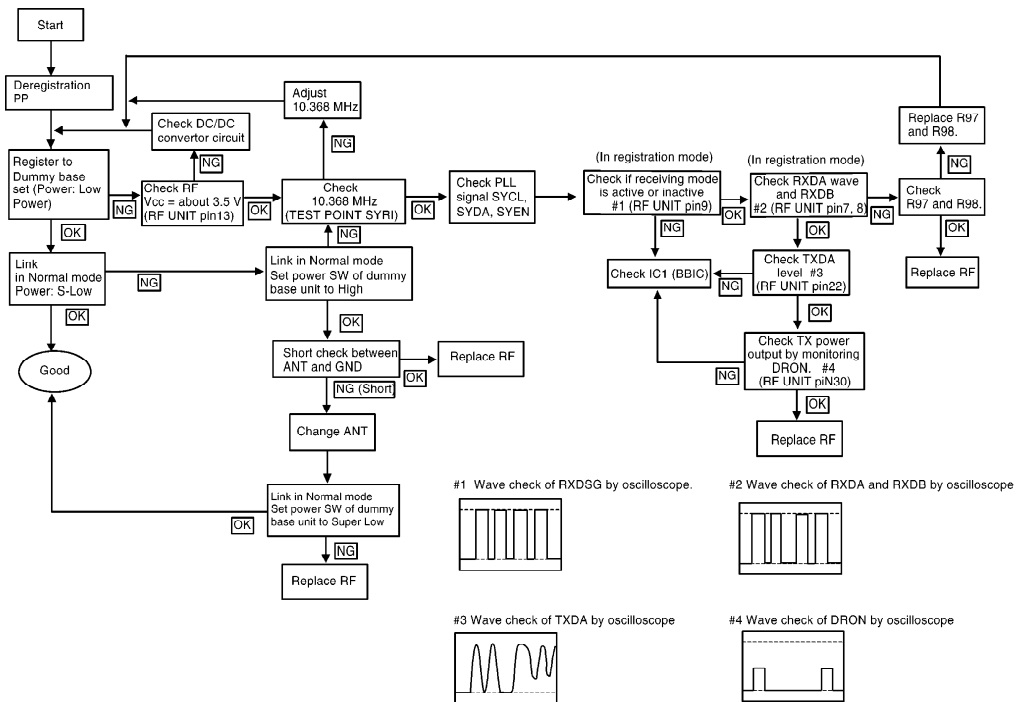

9.1.6. Registration can't operate

Check: Can the registration between the base unit and cordless handset be done?

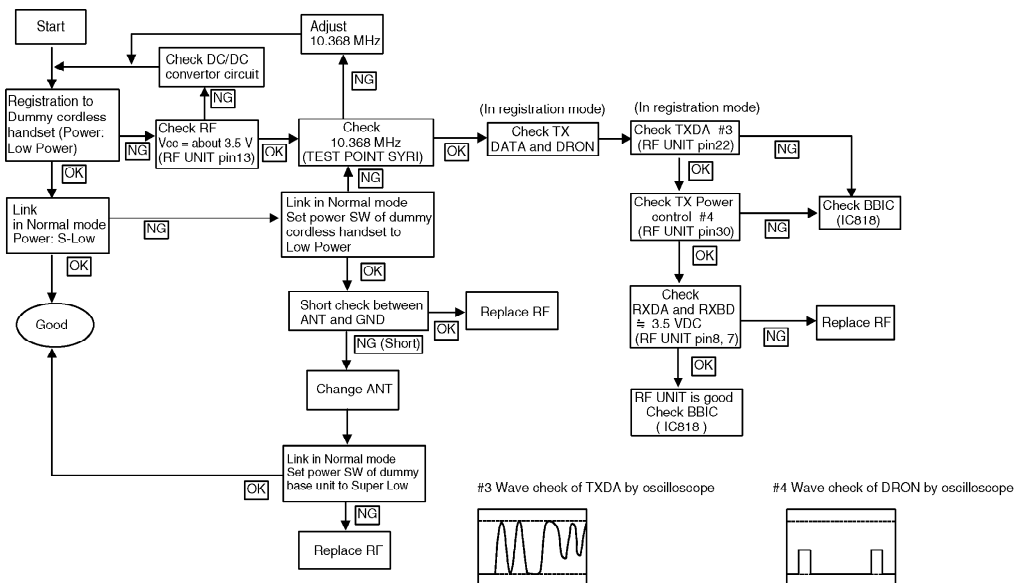

9.2. RF check flowchart for cordless handset

In this flowchart, to check if there is a problem in cordless handset, dummy base unit is used. / Dummy base unit has 2 kinds of TX power level, its level can be changed by power SW. / One is "Low Power", another is "Super Low Power".

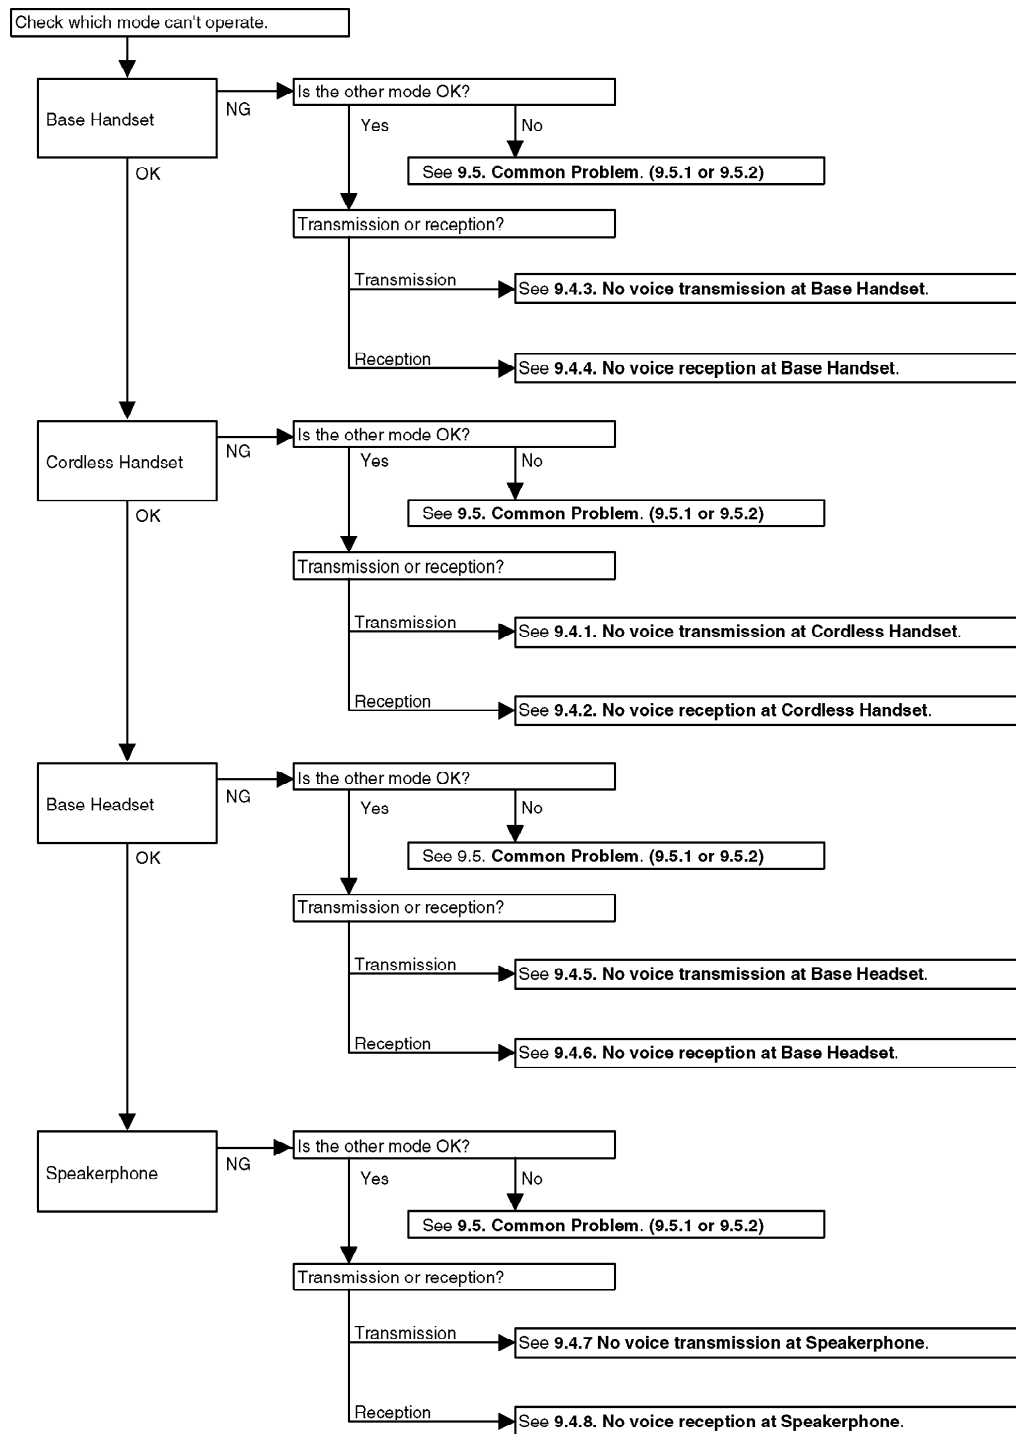

9.3. RF check flowchart for base unit

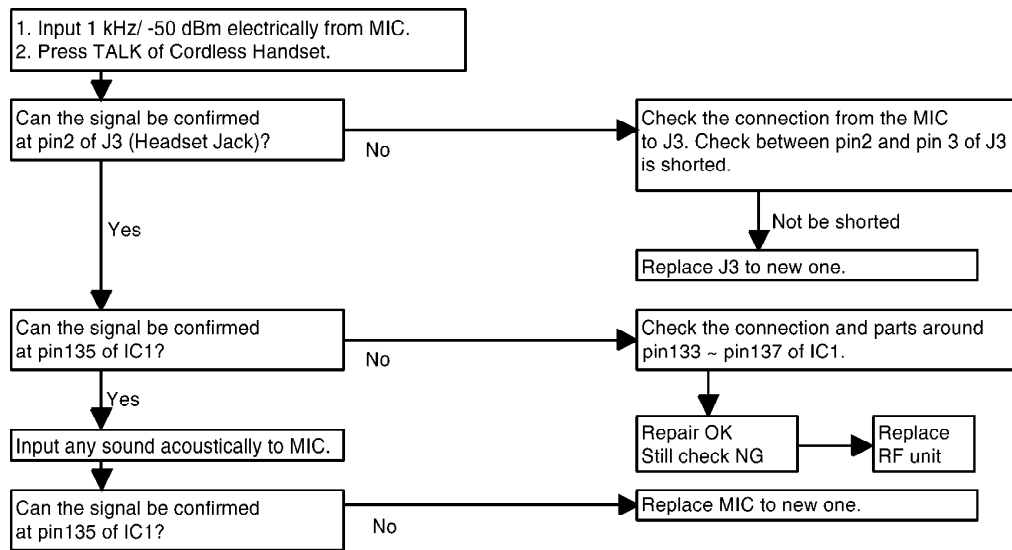

In this flowchart, to check if there is a problem in base unit, dummy base unit is used. / Dummy base set has 2 kinds of TX power level, its level can be changed by power SW. / One is "Low Power", another is "Super Low Power".

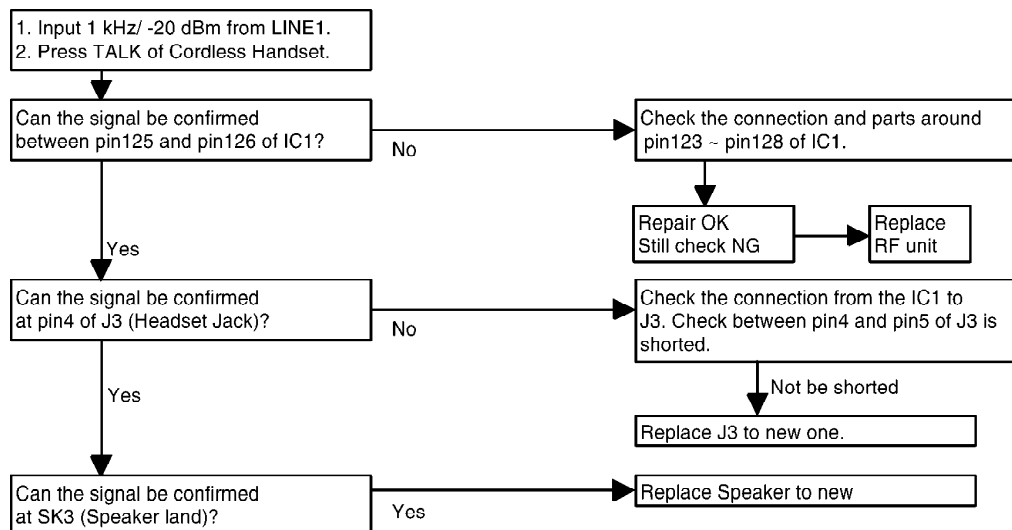

9.4. Problem While Calling

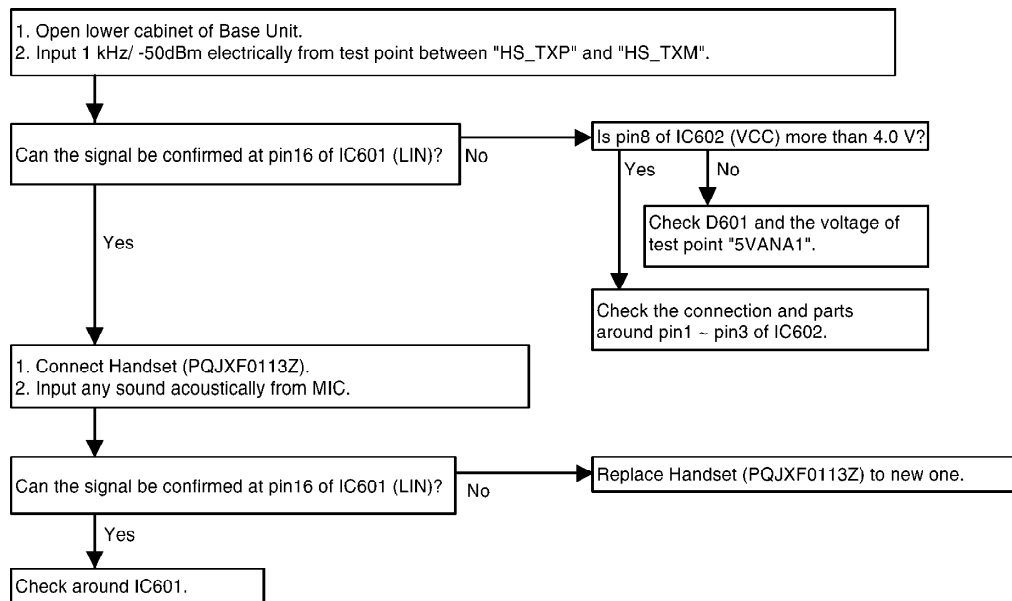

9.4.1. No voice transmission at Cordless Handset

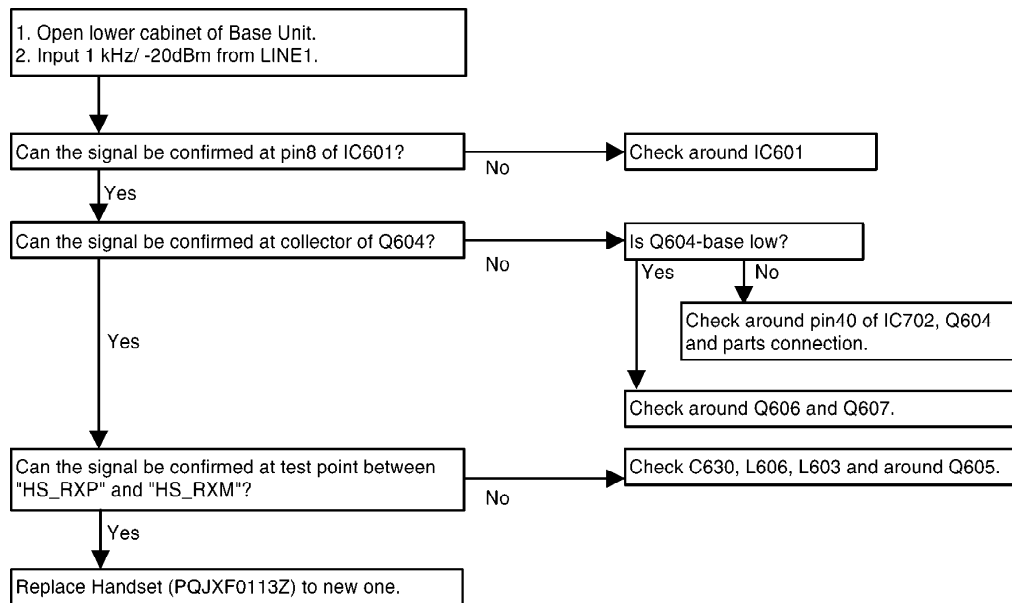

9.4.2. No voice reception at Cordless Handset

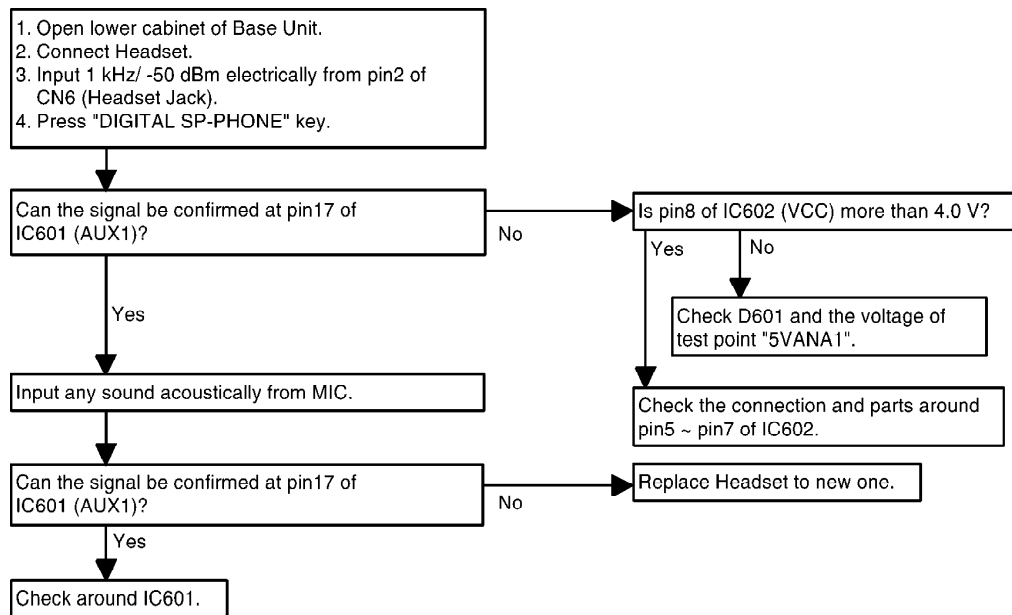

9.4.3. No voice transmission at Base Handset

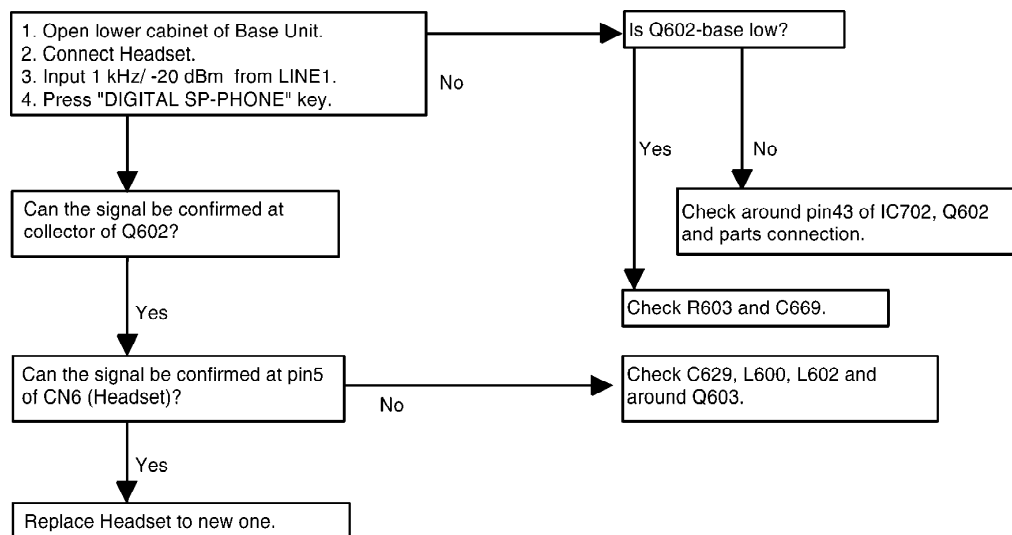

9.4.4. No voice reception at Base Handset

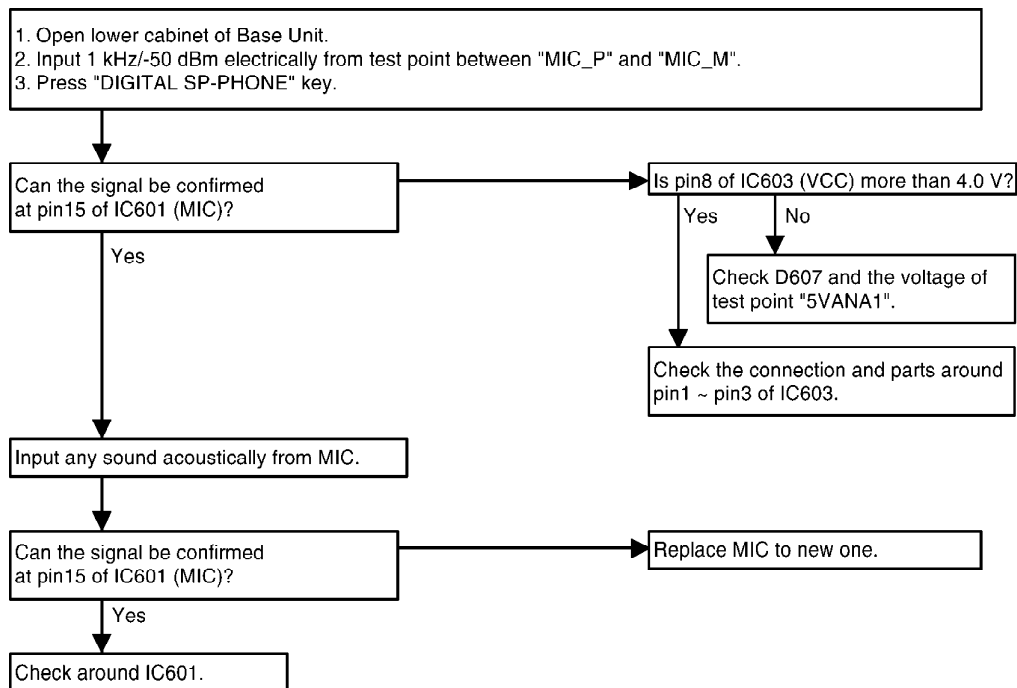

9.4.5. No voice transmission at Base Headset

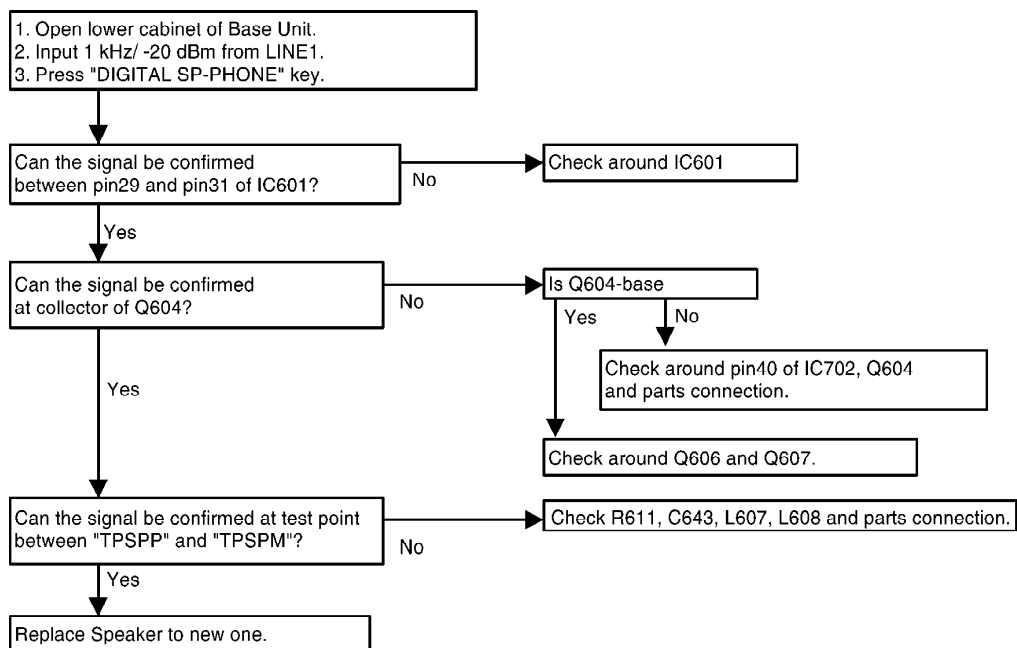

9.4.6. No voice reception at Base Headset

9.4.7. No voice transmission at Speakerphone

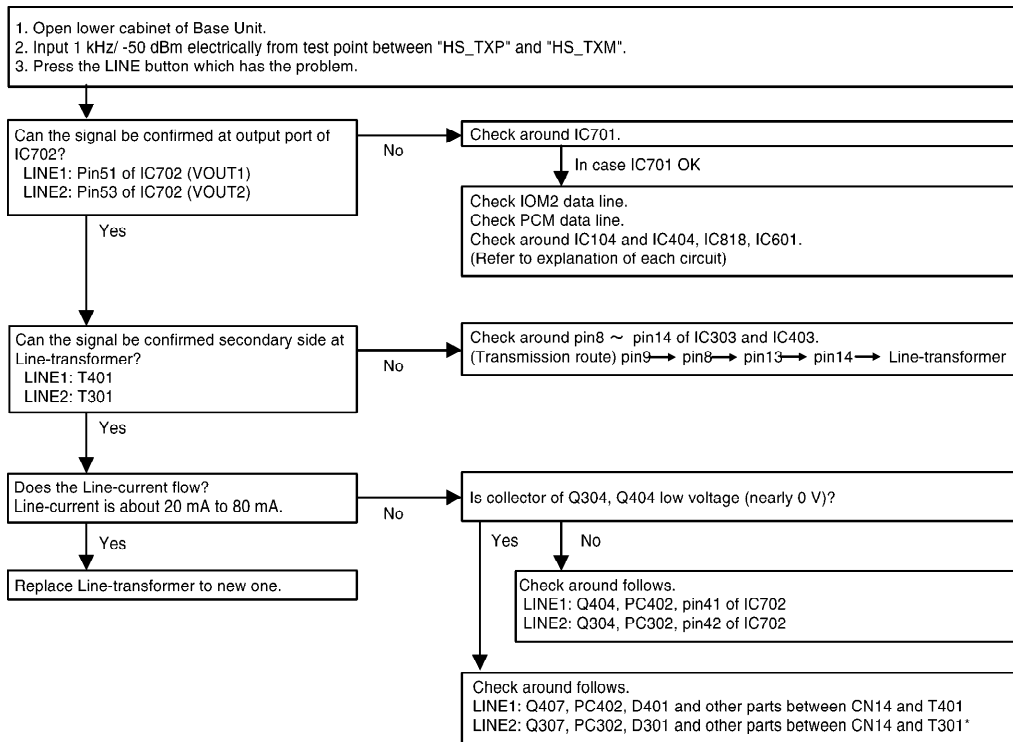

9.4.8. No voice reception at Speakerphone

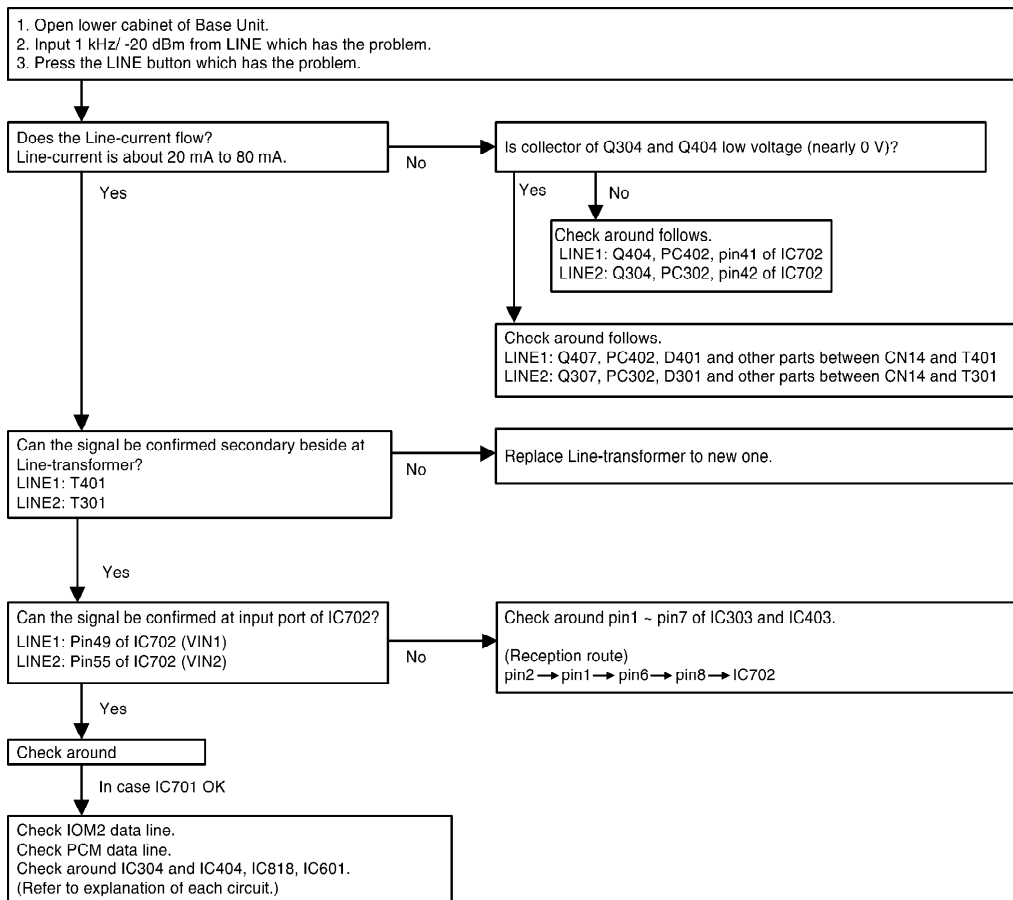

9.5. Common Problem

9.5.1. No voice transmission at any mode

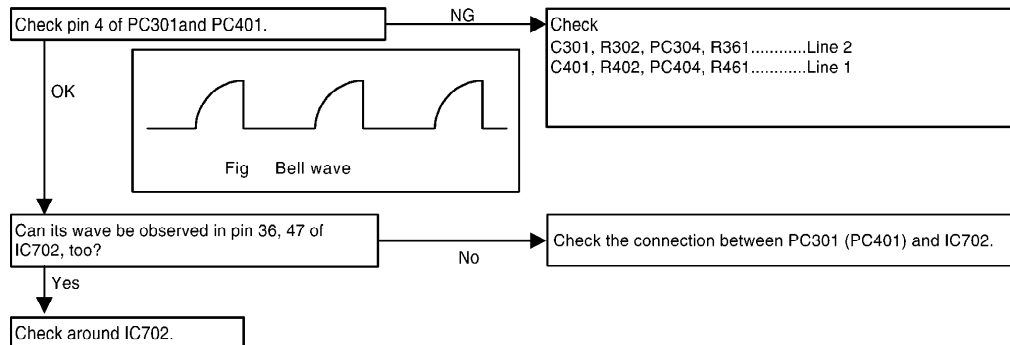

9.5.2. No voice reception at any mode

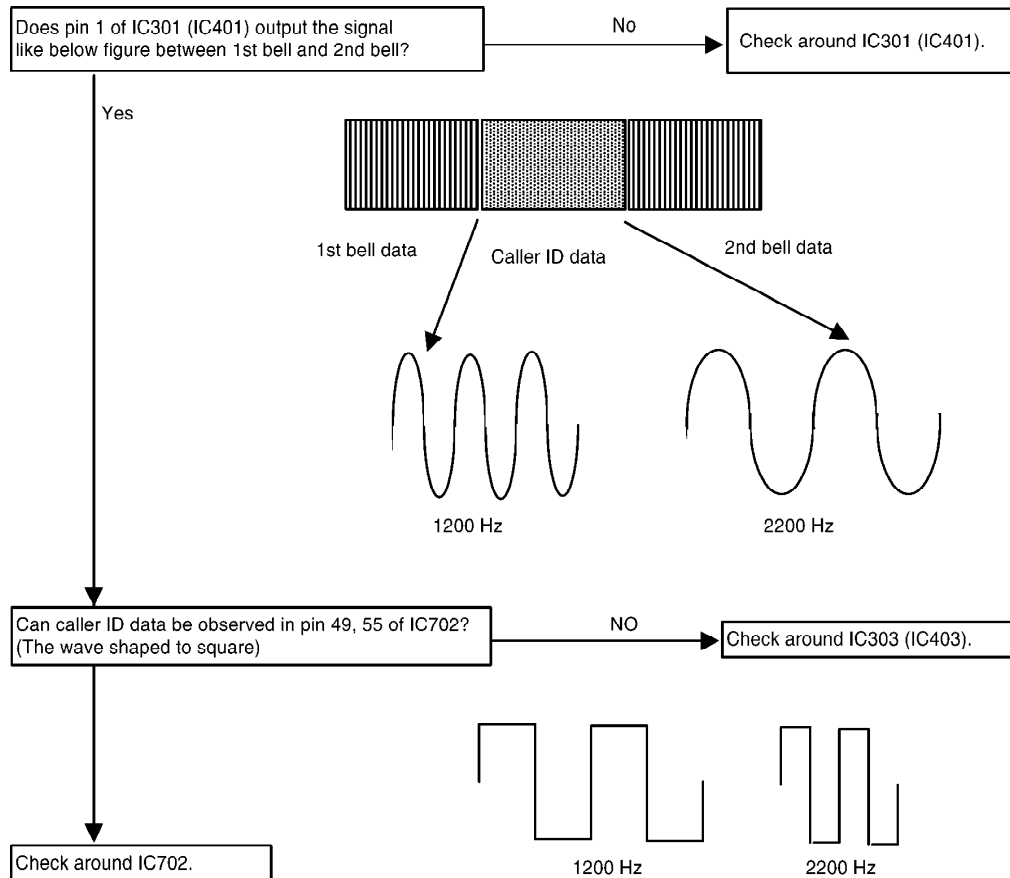

9.6. Bell and Call ID Problem

9.6.1. Bell can not be detected

9.6.2. Call ID can not be detected

9.7. Error Message When The Power Supply

If the Base unit has problems when the power supply, Error Message is indicated to LCD. / Message is indicated as follows.

Fig Ex. 1

Fig Ex. 2

F · · · FLASH ERROR (IC705)

If an area of FLASH ROM (IC705) is missing or having some problems, LCD indicates this error.
The error is possible to indicate from "A" to "H", all indication mean Memory destruction of FLASH ROM.
If this error indicates, change FLASH ROM to new one installed initial data.

D · · · DSP ERROR (IC104, IC404)

If a DSP does not answer, or an answer is wrong, LCD indicates this error. Meaning of Error message is follows.

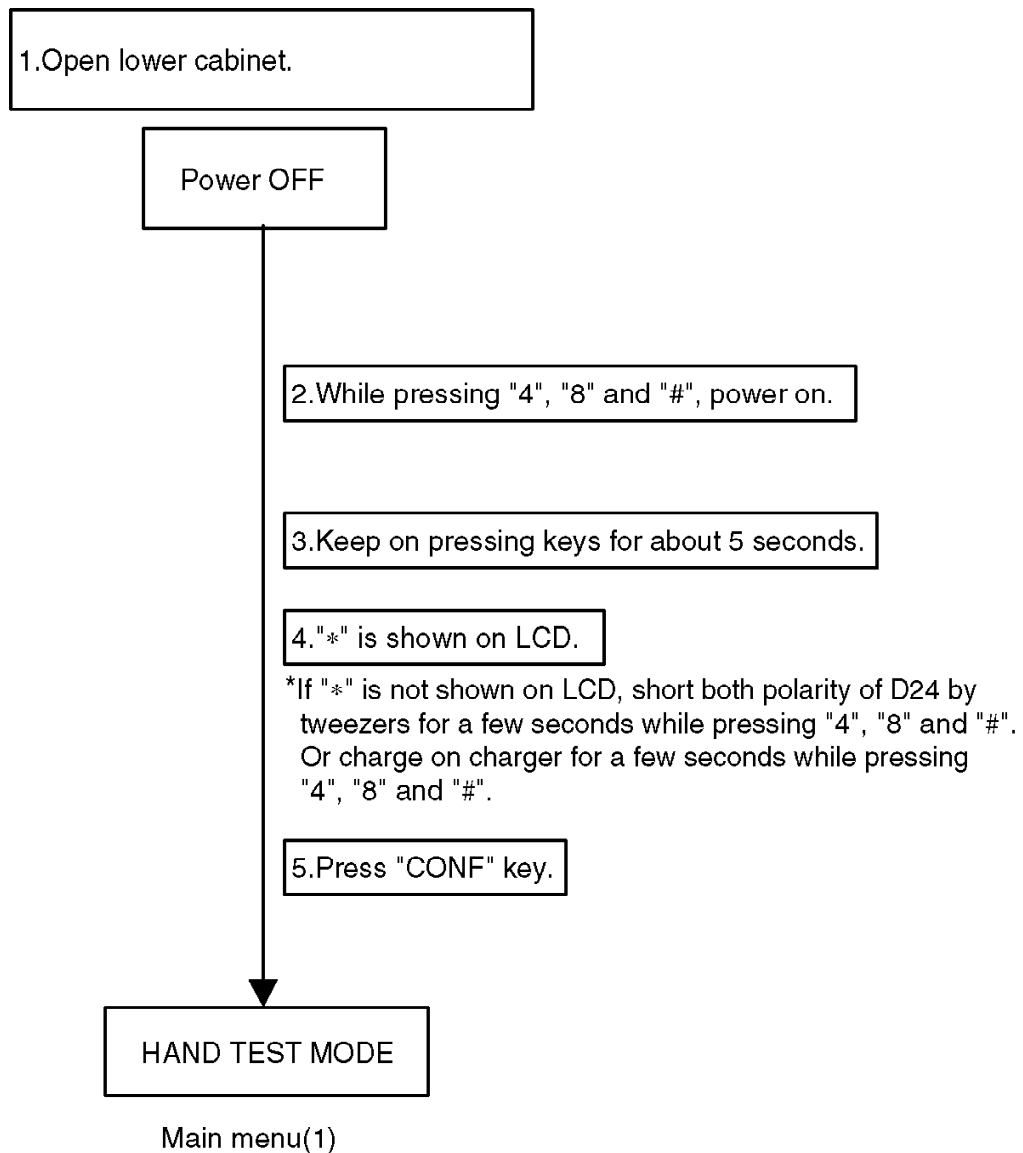

- "1" · · · IC104 does not answer.
- "4" · · · IC404 does not answer.
- "A" · · · IC104 can answer, but data is wrong.
- "D" · · · IC404 can answer, but data is wrong.

If this error indicates, Check the connection between IC701 (Sub CPU) and each DSP.

10. TEST MODE

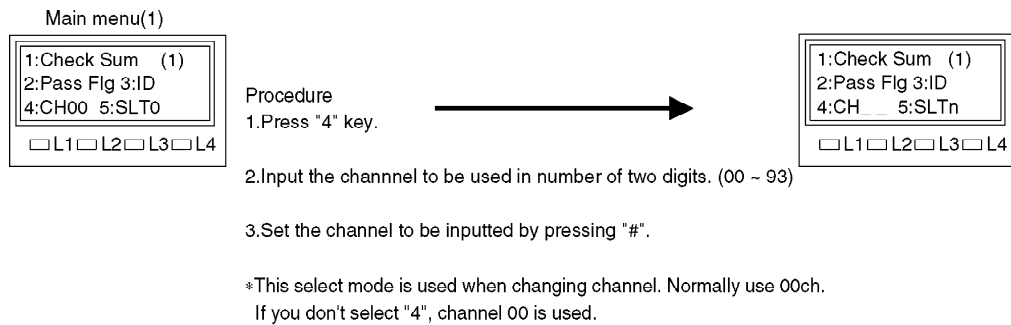

10.1. Test Mode Flow Chart for Maintenance of the Cordless Handset

Power supply: DC 2.6 V

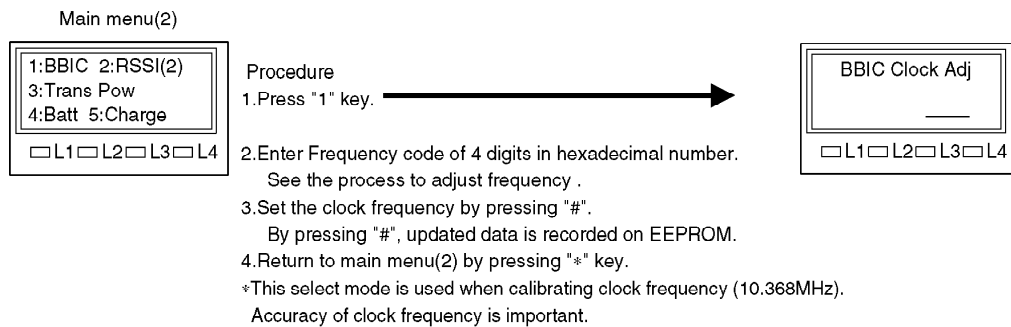

10.1.1. Test Mode Setting Method 2

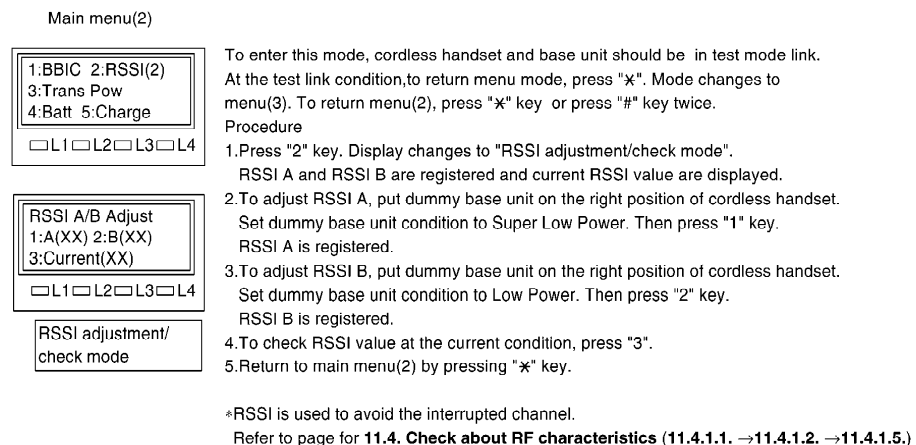

The explanation of transition between the hand test mode condition and the each mode.
Items with "*" is used for maintenance.

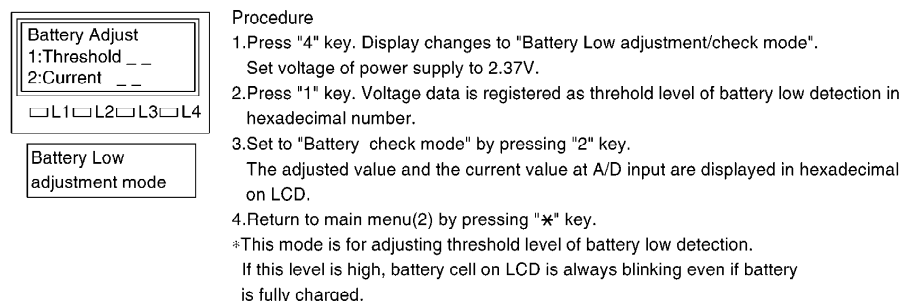

10.1.5. Clock Adjustment

10.1.6. RSSI Adjustment/Confirmation

10.1.7. Battery Low Voltage Detection Adjustment/Check

10.1.8. Setting the Charging Control

Procedure

1. Press "5" key. Mode changes to charge control mode.
2. By pressing "1" key (Normal charge) or "2" key (Trickle), select charge control mode.
3. Return to main menu (2) by pressing "*" key.

*Charging current is controlled by cordless handset.

To check the charging current is proper, check charging current by using this test mode. This mode is used when measuring battery charge current with the charger.

10.1.9. Link

At the condition that base unit is waiting for the signal from cordless handset.

1. Press "2" key.
Display shows "Just a moment"
2. When cordless handset can be synchronized with base unit, display changes to below figure.

*Base unit and cordless handset can communicate in test mode.

Refer to 11.4.1.2. **The method to set to TEST MODE LINK.** In this link frequency is not hopping.

10.1.10. LCD contrast

LCD contrast value should be changed by LCD to be used.

1. Press "4" key.
2. By pressing "1" key, this value is decreased.
5→4→3→2→1→7.....
By pressing "1" key, this value is increased.
5→6→7→1→2.....

In case of LNY163C02
Select 5
In case of PQADGP0741GN
Select 0

After selecting LCD contrast value press "#" key. By this procedure contrast value is fixed.

10.1.11. Model Code/Country Code

This item is used for entering Model code and Country code.
If EEPROM is changed to new one, this code should be checked.

1. Model code and country code can be changed by below step.

By pressing "1" key, model code number is decreased (-1).
By pressing "3" key, model code number is increased (+1).

Model code is assigned→
0: 2 LINE model (KX-TG2000CB)
1: 4 LINE model (KX-TG4000B)

By pressing "4" key, country code number is decreased (-1).
By pressing "6" key, country code number is increased (+1).

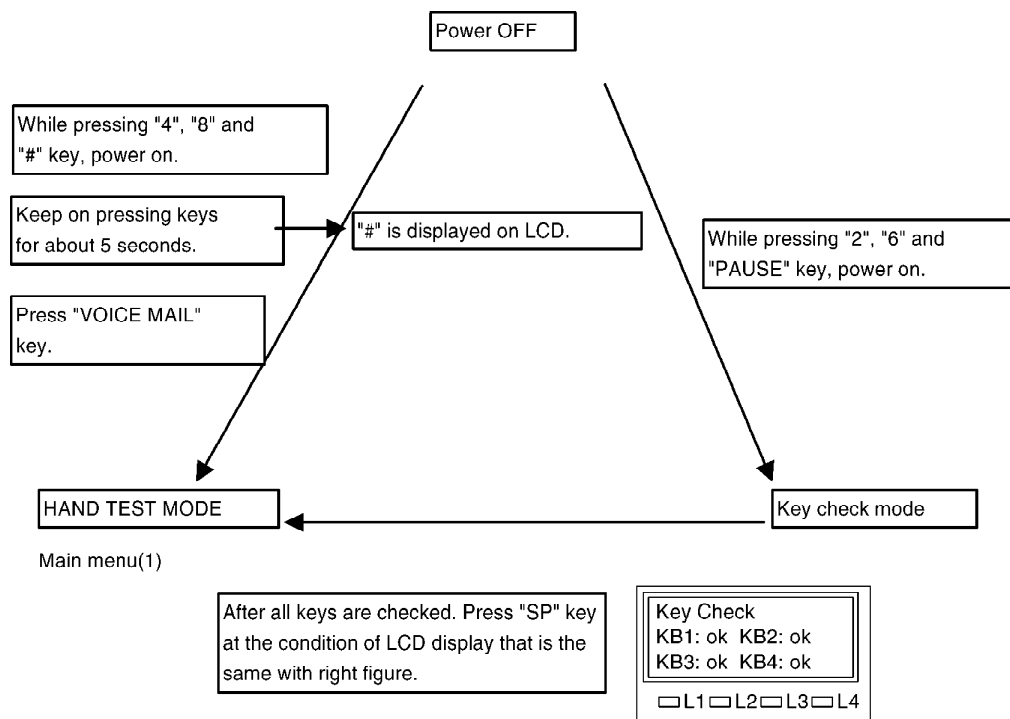

Country code is assigned→
0: USA model
1: Canada model

After inputting proper code, press "#" key, by pressing "#" key, these data is stored in EEPROM.
To return to main menu (3), press "*" key.

10.2. Test Mode Flow Chart for Maintenance of Base Unit

10.2.1. Test mode setting method 1

***Set hook SW handset to ON, except handset mode.**

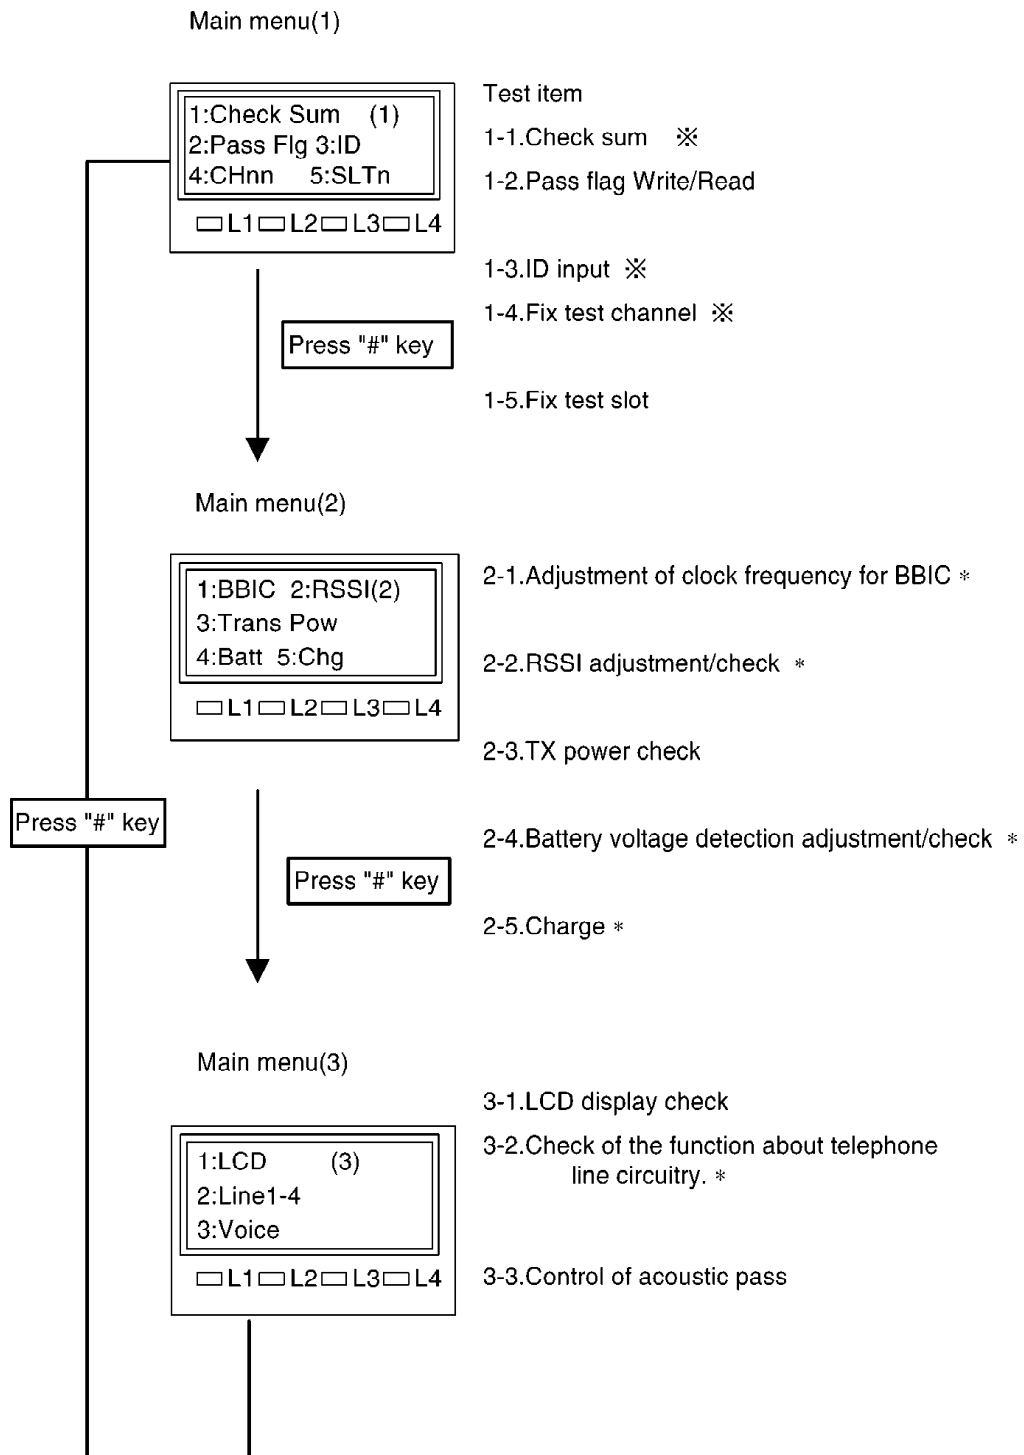

Menu to test mode is displayed on LCD.

Test mode with * is used for maintenance.

10.2.2. Test mode setting method 2

The explanation of transition between the hand test mode condition and the each mode.

10.2.3. Check Sum

Main menu(1)

1:Check Sum (1)
2:Pass Flg 3:ID
4:CHnn 5:SLTn
□L1□L2□L3□L4

Procedure

1.Press "1" key.

2.Check version of ROM.

M:Rom(IC806) for Main CPU

→ Software of main CPU(IC805) is in IC806(Flash memory)

V:Rom(IC703) for Sub CPU

→ Software of sub CPU(IC701) is in IC703(Flash memory)

*Function of set is determined by this ROM version.

Ver Chck Sum
M:xxxxx xxxx
V:xxxxx xxxx
□L1□L2□L3□L4

10.2.4. ID Check/Write

ID Code
xxxxxxxxxx
□L1□L2□L3□L4

ID check/write mode

This data should not be written in normal repairing. Only when EEPROM(IC803) is exchanged to new one,same ID should be written in below process.

1.Press "3" key. → Current ID data is displayed. (In case of new EEPROM, all "0" is displayed.)

2.Enter the same ID number of last EEPROM in 10digits of hexadecimal.

See 11.1. **Clock Frequency Adjustment (for base unit and cordless handset).**

3.To write it to EEPROM,press "#" key.

4.To exit ID check/write mode,press "X" key.

10.2.5. Fix Test Channel

Main menu(1)

1:Check Sum (1)
2:Pass Flg 3:ID
4:CHnn 5:SLTn
□L1□L2□L3□L4

Fix test channel

Procedure

1.Press "4" key.

2.Input the channel to be used in number of two digits. (00~93)

3.Set the channel to be inputted by pressing "#".

4.Return to main menu(1) by pressing "*" key.

1:Check Sum (1)
2:Pass Flg 3:ID
4:CH00 5:SLT0
□L1□L2□L3□L4

*This select mode is used when changing channel. Normally use 00ch.

If you don't select "4",channel 00 is used.

10.2.6. Clock Adjustment/Confirmation

1:BBIC 2:RSSI(2)
3:Trans Pow
4:Batt 5:Chg
□L1□L2□L3□L4

Procedure

1.Press "1" key. Display changes to "Clock adjustment/check mode"

2.Enter Frequency code of 2 digits in hexadecimal number.

See the process to adjust frequency.

3.Set the clock frequency by pressing "#".

By pressing "#" key,updated data is registered on EEPROM.

4.Return to main menu(2) by pressing "X"key.

BBIC Clock Adj
--
□L1□L2□L3□L4

*This select mode is used when calibrating clock frequency (10.368MHz).

Accuracy of clock frequency is important.

Refer to 11.1. **Clock Frequency Adjustment (for base unit and cordless handset)** about detail.

10.2.7. RSSI Adjustment/Confirmation

Refer to **Registration**, **The method to set to TEST MODE LINK** and **The method to adjust RSSI A, B**.

10.2.8. Battery Voltage Detection Check

Procedure

1. Press "4" key. Display changes to "Battery check mode".

2. Set to "Battery low detect mode" by pressing "1" key.

Battery detect starts.

*Before pressing "1", don't supply DC voltage to battery connector.

If so, current from AC adaptor flows to battery connector.

3. Supply DC voltage to CHG_P(+) and CHG_M(-) (battery connector) of backside

When changing DC voltage, "BATTERY" LED condition changes as below.

Supply voltage	"BATTERY" LED condition
6.9V	ON
6.3V	Blinking
5.7V	OFF

4. Return to main menu(2) by pressing "*" key.

*"BATTERY" LED is used for indicating the condition of back-up battery.

This back-up battery is used at power failure.

(Explanation of back-up battery)

When set is working by AC power at the condition that back-up battery is connected, if power failure happens, back-up battery is available.

From AC power to back-up battery, power is changed automatically.

But if back-up battery is connected to set without AC power, set doesn't work. Back-up battery is used at AC power failure.

10.2.9. Battery Charge Control

1. Every time "5" key is pressed, charge condition is changed (ON/OFF).

Check whether charge control works properly by measuring battery terminal without battery.

Charge OFF : less than 2 V

Charge ON : 10 ± 2 V

Charge control mode

2. To return to menu(2), press "*" key.

10.2.10. Function Check About Telephone Line Circuitry

Main menu(3)

1:LCD (3)
2:Line1-4
3:Voice

☐ L1
☐ L2
☐ L3
☐ L4

Procedure

1.Press "2" key. Display changes to "Telephone line circuitry check mode".

Line 1:Line:_
2:OGM 3:C-ID C-W

☐ L1
☐ L2
☐ L3
☐ L4

Telephone line circuitry check mode

2.Press "1" key. Condition changes to "Line selection condition".

3.Select the line to be used.

1:Line1, 2:Line2, 3:Line3, 4:Line4, 5:All line (Line1 ~ Line2) *_:This is not available.

4.Press "4" key. Mode changes to "IN USE DETECTION mode".

In Use
1:Hook ON *OFF
2:Mode *A B

☐ L1
☐ L2
☐ L3
☐ L4

IN USE DETECTION mode

5.Press "1" key. Mode changes to "Selection mode of HOOK condition".

By moving "*", "HOOK" condition is selected.

Every time "1" is pressed, "*" is moved.

Pressing "✳" key makes the HOOK condition fix.

6.Press "2" key. Mode changes to "Selection mode of IN USE condition".

By moving "*", "LINE Mode" condition is selected.

Every time "2" is pressed, "*" is moved.

Pressing "✳" key makes LINE mode fix.

Display returns to Telephone line circuitry check mode.

7.Display returns to main menu(3) by pressing "✳" key.

Mode A: telephone line for 48V, Mode B: telephone line for 24V.

To check whether IN USE Detection circuit works properly,
set condition to ON-Hook.

A mode T-R 27V LINE LED ON

33V LINE LED OFF

B mode T-R 17V LINE LED ON

20V LINE LED OFF

10.2.11. Check of the Function About Telephone Line Circuitry

Main menu(3)

1:LCD	(3)
2:Line1-4	
3:Voice	
<input type="checkbox"/> L1 <input type="checkbox"/> L2 <input type="checkbox"/> L3 <input type="checkbox"/> L4	

Procedure

1. Press "2" key. Display changes to "Telephone line circuitry check mode".

Line 1:Line:_
2:OGM 3:C-ID C-W
4:In Use
<input type="checkbox"/> L1 <input type="checkbox"/> L2 <input type="checkbox"/> L3 <input type="checkbox"/> L4

Telephone circuitry check mode

2. Greeting record starts at the same time that "2" key is pressed.
At the same time the appointed line is caught.

*Greeting record is done from microphone of set.

OGM Rec/Play
1:Rec End/Play
PriOGM 2:En 3:Fr
<input type="checkbox"/> L1 <input type="checkbox"/> L2 <input type="checkbox"/> L3 <input type="checkbox"/> L4

3. Greeting play starts to output to speaker of set at the same time that "1" key is pressed.

4. Pressing "2" key, message in voice prompt "thank you for calling" is played.

5. To return to main menu, press "*"

10.2.12. Link at Test Mode

Voice Pass Ctl
1:Line n 2:Sel 1
3:Exe 4:DTMF
<input type="checkbox"/> L1 <input type="checkbox"/> L2 <input type="checkbox"/> L3 <input type="checkbox"/> L4

1. Press "3" key at Main menu(3).
2. Press "2" key to select communication mode.
3. Press "4" key to communicate with cordless handset. (In case of cordless handset)
 - 1: Handset
 - 2: Headset
 - 3: SP-phone
 - 4: Cordless handset
4. Press "3" key.

In this process, base unit is waiting for signal from cordless handset.

Refer to **Registration, The method to set to TEST MODE LINK** about details to use TEST MODE LINK.

10.2.13. Country/Model Code

This item is used for confirming country code and model code.
If this code is different, some function doesn't work properly.
This code can be changed by below process.

1. While pressing "4", "8" and "#" keys, power on. → "#" is displayed on LCD.
2. Press Intercom/Transfer "8" key. → Country/Model check mode.

Country/Model (4)	
00	01
<input type="checkbox"/> L1 <input type="checkbox"/> L2 <input type="checkbox"/> L3 <input type="checkbox"/> L4	

On this display condition, input proper code in 4 digits.

3. Country code should be as below.
USA: 00
CANADA: 01

Model code should be as below.
2 LINE model: 00
4 LINE model: 01

4. If different code was registered, enter correct number.
5. After entering correct number, press "#" key. By pressing "#", new code is stored.
6. Power off.

11. ADJUSTMENT

11.1. Clock Frequency Adjustment (for base unit and cordless handset)

(Cordless Handset)

1. Set to hand test mode.
2. Press "#" key. → Main menu(2).
3. Press "1" key. → Clock adjustment mode.
4. Enter "805D" (in hexadecimal number) as initial value. Refer to hexadecimal number. (Table A)
8: "8" key, 0: "0" key, 5: "5" key, D: "BACK" key.
5. Press "#" key.
6. Measure the frequency at test point of SYRI.
7. Calculate the frequency difference between the current frequency and 10.368 MHz.
ex.) Measure frequency is 10,368,120 Hz. Frequency difference to 10,368,000 Hz is +120 Hz.
8. Enter "80CB". (4 hexadecimal number referring to table B)
9. Press "#" key.
10. By pressing "✕", return to menu.

11. Check the frequency at test point of SYRI.

Frequency should be 10.368 MHz \pm 30 Hz.

(Base Unit)

1. Set to hand test mode.

2. Press “#” key.

Measure clock frequency at test point “SYRI”. If frequency difference between it and 10.368MHz is within \pm 31Hz, OK. If out of range, go to next step.

3. Press “1” key. → Clock adjustment mode.

4. Enter “74” (in hexadecimal number) as initial value. Refer to Table A.

5. Press “#” key.

6. Measure the frequency at test point of SYRI.

7. Calculate the frequency difference between the current frequency and 10.368 MHz.

ex.) Measure frequency is 10,368,120 Hz. Frequency difference is + 120 Hz.

8. Enter “47” (2 hexadecimal number referring to table C).

9. Press “#” key.

10. Measure the frequency at test point of SYRI.

11. By pressing “✕”, return to menu.

Frequency should be 10.368 MHz \pm 30 Hz.

11.2. Battery Low Adjustment

(Cordless Handset)

1. Set to hand test mode. → menu (1).

2. Press “#” key. → menu (2).
3. Press “4” key. → Batt.Low adjustment mode.
4. Change DC voltage of battery terminal to 2.37 V.
5. Press “1” key. → Battery Low detect voltage is registered.
6. Press “#” key.
7. By pressing “✕”, return to menu mode.
Adjustment spec. of battery low is DA to E1.

11.3. Battery Detection Confirmation (This item is not for adjustment.)

(Base unit: Backup battery)

1. Set to hand test mode. → menu (1).
2. Press “#” key. → menu (2).
3. Press “4” key. → Batt.Low check mode.
4. Press “1” key. → Battery detection mode starts.
Supply DC voltage to battery connector.
5. Change DC voltage of battery terminal to 6.9 V.
6. Check that back-up LED is on.
7. Change DC voltage of battery terminal to 6.3 V.
8. Check that back-up LED is blinking.
9. Change DC voltage of battery terminal to 5.7 V.
10. Check that back-up LED is off.
Remove DC power supply.
11. By pressing “✕”, return to menu mode (2).

11.4. Check about RF characteristics

(In case of base set adjustment)

To set RSSI adjustment mode, base unit and cordless handset should be in test link mode. / When adjusting RSSI value of base unit, cordless handset should be dummy set supplied by KME. / As well when adjusting RSSI value of cordless handset, base unit should be dummy set supplied by KME. / In advance they should be registered.
Use the dummy cordless handset. Set SW to super low mode.
After step 1 to 11 (Test link procedure),

11.4.1. Inspection (Dummy set - product)

Before judging which has failure in base unit or cordless handset, the registration needs to be done between dummy set and product.

Dummy set has the below characteristics.

Dummy set has the switch to change TX power at the back of cabinet.

(Low Power)

Lower power level than normal product. "At this level, RSSI B of product can be adjusted on the radiation condition, not PCB."

Worse sensitivity than normal product. "At this sensitivity, radiation power of product can be checked by measuring RSSI level." by oscilloscope.

(Super Low Power)

Lower power level than "Low power condition". At this level, RSSI A of product can be adjusted on the radiation condition, not PCB.

Sensitivity is same with "Lower Power condition".

11.4.1.1. Registration

Set power switch of dummy set to Low Power side.

Registration between dummy cordless handset and base unit (product)

1. The registration information of last base unit registered in dummy cordless handset should be deleted. → After deregistration the display on LCD should be [—].
2. Check power switch position of dummy cordless handset is "Low Power" side.
3. Execute the registration between dummy cordless handset and base unit.

(Base unit)

2-1. At stand-by condition, press "FUNCTION" button.

2-2. Select "Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key.

2-3. Select "HS Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key.

2-4. Check the display on LCD is "Handset registering".

(Cordless handset)

On this condition of base unit,

2-5. At stand-by condition, press "FUNCTION" button.

2-6. Select "Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key.

2-7. Select "HS registration" by pressing "UP" or "DOWN" key.

2-8. If beep of cordless handset sounds, the registration between base set and cordless handset finishes.

2-9. To exit registration mode, press "EXIT" key of base unit.

Note

This registration should be done within one minute. If any process are not done in one minute, registration mode is exited.

Check whether base unit has faults.

Registration between dummy base unit and cordless handset (product)

1. The registration information of base unit registered in cordless handset should be deleted. → After deregistration, the display on LCD should be [—].
2. Check power switch position of dummy base unit is "Low Power" side.
3. Execute the registration between dummy base unit and cordless handset.

(Base unit)

2-1. At stand-by condition, press "FUNCTION" button.

2-2. Select "Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key.

2-3. Select "HS Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key.

2-4. Check the display on LCD is "Handset registering".

(Cordless handset)

On this condition of base unit,

2-5. At stand-by condition, press "FUNCTION" button.

2-6. Select "Registration" by pressing "UP" or "DOWN" key. Then press "FWD" key."

2-7. Select "HS registration" by pressing "UP" or "DOWN" key.

2-8. If beep of cordless handset sounds, the registration between base unit and cordless handset finishes.

2-9. To exit registration mode, press "EXIT" key of base unit.

Note

This registration should be done within one minute. If any process are not done in one minute, registration mode is exited.

Check whether cordless handset has faults.

11.4.1.2. The method to set to TEST MODE LINK

Registration between product and dummy set needs before LINK test. Set power switch of dummy set to Low Power side.

(Base Unit)

1. While pressing "4", "8" and "#", power on. → "#" on LCD is displayed.
2. Press "VOICE MAIL" key. → It becomes TEST MODE main menu(1).
3. Press "#" key twice. → It becomes TEST MODE main menu(3).
4. Press "3" key. (VOICE) → It becomes Voice Pass menu.
5. Press "2" key. (Select) → It becomes mode selection condition.
6. Press "4" key. → It becomes voice pass mode to cordless handset.

Select 1: Base handset

Select 2: Base headset

Select 3: SP-phone

Select 4: Cordless handset

7. Press "3" key. (Execute) → Voice pass to cordless handset is

connected.
(Cordless handset)

8. While pressing "4", "8" and "#", connect battery. → "✕" on LCD is displayed.
* If "✕" on LCD is not displayed by connecting battery, charge on charger for a few seconds while pressing "4", "8" and "#".
9. Press "CONF" key. → It becomes TEST MODE main menu(1).
10. Press "#" key twice. → It becomes TEST MODE main menu(3).
11. Press "2" key. (LINK) → After cordless handset can synchronize with base unit, cordless handset send TX DATA to base unit. Then LINK is carried out.

11.4.1.3. Radiation sensitivity check

Registration between product and dummy set needs before LINK test.

Set power switch of dummy set to Low Power side.

— Put cordless handset on the left side of base unit.

— Raise antenna of base unit vertically to the desk.

— Put cordless handset on the desk so that LCD side of cordless handset faces upwards.

In case that dummy set is cordless handset. → It means that set under sensitivity test is base unit of product.

Set both base unit and dummy cordless handset to TEST MODE.

Execute Link in test mode condition.

1. Input acoustic signal to MIC of cordless handset.
2. Check whether there is no noise in line output(L1). If there is no signal in line output or sometimes signal to line output is muted as below figure, sensitivity of base unit is bad.

In case that dummy set is base unit. → It means that set under sensitivity test is cordless handset of product.

Set both dummy base unit and cordless handset to TEST MODE.

Execute Link in test mode condition.

1. Input signal to line(L1).
2. Check whether there is no noise in speaker output of cordless handset. If there is no signal in speaker output or sometimes signal to speaker output is muted as below figure, sensitivity of cordless handset is bad.

11.4.1.4. Radiation power check

Registration between product and dummy set needs before LINK test.

Set power switch of dummy set to Low Power side.

— Put cordless handset on the left side of base unit.

— Raise antenna of base unit vertically to the desk.

— Put cordless handset on the desk so that LCD side of cordless handset faces upwards.

In case that dummy set is cordless handset. → It means that set under radiation power check is base unit.

Set both base unit and dummy cordless handset to TEST MODE.

Execute Link in test mode condition.

Measure RSSI level of dummy cordless handset by oscilloscope as below figure.

RSSI level : More than 1.5Vp-p

By measuring RSSI of dummy set, radiation power of product can be checked.

In case that dummy set is base unit. → It means that set under radiation power check is

cordless handset.

Set both dummy base unit and cordless handset to TEST MODE.

Execute Link in test mode condition.

Measure RSSI level of dummy base unit by oscilloscope.

RSSI level : More than 1.5Vp-p

By measuring RSSI of dummy set, radiation power of product can be checked.

11.4.1.5. The method to adjust RSSI A, B

Registration between product and dummy set needs before LINK test.

— Put cordless handset on the left side of base unit.

— Raise antenna of base unit vertically to the desk.

— Put cordless handset on the desk so that LCD side of cordless handset faces upwards.

In case that dummy set is cordless handset. → It means that set under adjusting RSSI is base unit.

(RSSI adjustment for base unit)

Set both base unit and dummy cordless handset to TEST MODE.

Execute Link in test mode condition.

1. Set power switch of dummy cordless handset to "Super Low Power" side. To adjust RSSI A of base unit, execute next process to base unit.
2. Press "✕" key twice → By this procedure, line is released, but LINK is continued.
3. Press "#" key twice. → TEST MODE main menu(2)
4. Press "2" key to set to RSSI adjustment mode.
5. Press "1" key. → RSSI A
6. Press "3" key. → By this procedure, RSSI A value is written in memory.

*** Power switch of dummy cordless handset should be "Super Low Power" side.**

- 7. Power off base unit.**
- 8. Execute the same procedure with Step 1 to 7 of B (the method to set to TEST MODE LINK.)**
- 9. Set power switch of dummy cordless handset to "Low Power" side. To adjust RSSI B of base unit, execute next process to base unit.**
- 10. Press "✕" key twice. → By this procedure, line is released, but LINK is continued.**
- 11. Press "#" key twice. → TEST MODE main menu(2)**
- 12. Press "2" key to set to RSSI adjustment mode.**
- 13. Press "2" key. → RSSI B**
- 14. Press "3" key. → By this procedure, RSSI B value is written in memory.**

*** Power switch of dummy cordless handset should be "Low Power" side.**
- 15. Power off base unit.**

Adjustment spec. of RSSI is:

RSSI A: 5480 to 95C0

RSSI B: 8140 to A640

RSSI B > RSSI A

In case that dummy set is base unit. → It means that set under adjusting RSSI is cordless handset.

(RSSI adjustment for cordless handset)

Set both base unit and dummy cordless handset to TEST MODE.

Execute Link in test mode condition.

- 1. Set power switch of dummy base unit to "Super Low Power" side. To adjust RSSI A of cordless handset, execute next process to cordless handset.**
- 2. Press "✕" key. → TEST MODE main menu(3)**
- 3. Press "# " key twice. → TEST MODE main menu(2)**

4. Press "2" key. → RSSI adjustment mode
5. Press "1" key. → By this procedure, RSSI A value is written in memory.
6. Set power switch of dummy base unit to "Low Power" side.
7. Press "2" key. → By this procedure, RSSI B value is written in memory.
8. To exit RSSI adjustment mode, press "✕" key.
9. Power off.

Adjustment spec. of RSSI is:

RSSI A: 44 to 70

RSSI B: 5B to B5

RSSI B > RSSI A

11.5. Frequency Table (MHz) for Base Unit and Cordless Handset

Table of channel frequency

TX frequency = RX frequency

CH	Frequency	CH	Frequency	CH	Frequency

31	2427.840	63	2455.488		

11.6. Replacement of EEPROM (IC4 for Cordless Handset, IC803 for Base Unit)

Some data are written in EEPROM. (Gain parameter, frequency code, RSSI code, ID etc.) / If EEPROM is changed to new one, some data of them are written as initial value automatically. / But ID should be inputted and, frequency, battery low (only cordless handset) and RSSI should be adjusted.

Cordless Hand set-jig

Remove back-up battery, when checking function, and setting to test mode.

11.7. Check Table for RF Block

		Base unit	Cordless handset
1 Registration & Link confirmation Refer to Registration	Procedure	1 Deregistration base unit and dummy cordless handset 2 Set Dummy power SW to Low Power 3 Registration 4 Press “Talk” key of Dummy cordless handset	1 Deregistration cordless handset and dummy base unit 2 Set Dummy power SW to Low Power 3 Registration 4 Press “Talk” key of cordless handset
	Check point	1 Check ID of base unit (Test Mode main menu (1))	1 Check ID of cordless handset (Test Mode main menu (1))
2 10.368MHz reference clock confirmation Refer to Clock Frequency Adjustment (for base unit and cordless handset)	Procedure	1 Select / “BBIC (Clock Adjust/confirmation)” mode (Test Mode main menu (2)) 2 Confirm clock frequency within 10.367969MHz~10.368031MHz at SYRI 3 When without Spec, input HEX code for adjusting Frequency. (Refer to Clock adjustment Table)	1 Select / “BBIC (Clock Adjust/confirmation)” mode (Test Mode main menu (2)) 2 Confirm clock frequency within 10.367969MHz~10.368031MHz at SYRI 3 When without Spec, input HEX code for adjusting Frequency. (Refer to Clock adjustment Table)
	Check point	1 Check some parts that are / X802, C889, C887, D814, R846 and R847.	1 Check some parts that are C32.
3 Tx Data confirmation	Procedure	1 Select “Trans Pow” mode (Test Mode main menu (2) - 3) 2 Select Data pattern “3” 3 When press “#” key, output Tx power and Tx Data 4 Confirm Tx Data level at RF terminal within 150mVp-p~250mVp-p Pin 22 of RF unit	1 Select “Trans Pow” mode (Test Mode main menu (2)) 2 Select Data pattern “3” 3 When press “#” key, output power and Tx Data 4 Confirm Tx Data level at RF terminal within 150mVp-p~250mVp-p Pin unit
	Check point	1 Check some parts that are R879, R928, R881, C855, C856, C857, L801, L802 and IC818.	1 Check some parts that are IC1.
4 Tx Power control	Procedure	1 Select “Trans Pow” mode	1 Select “Trans Pow” mode

		Base unit	Cordless handset
confirmation		(Test Mode main menu (2) - 3) 2 Select Data pattern "3" 3 When press "#" key, output Tx power and Tx Data 4 Confirm "DRON Pin 30 of RF unit" (Tx Power control signal) waveform at RF terminal 	(Test Mode main menu (2) 2 Select Data pattern "3" 3 When press "#" key, output power and Tx Data 4 Confirm "DRON Pin 30 of (Tx Power control signal) waveform at RF terminal 
	Check point	1 Check R895 and IC818.	1 Check R95 and R72.
5 Tx Power / confirmation Refer to Radiation power check	Procedure	1 Set Test mode Link to base unit and dummy cordless handset. / (Fixed channel link / Dummy Power SW: Low) 2 When base unit cannot link to dummy cordless handset, check RF unit following RF check flowchart. 3 Put base unit on the right side of dummy cordless handset. 4 Confirm RSSI level on the dummy cordless handset by using oscilloscope. RSSI Level: More than 1.5V	1 Set Test mode Link to cordless handset and dummy base (Fixed channel link / Dummy SW: normal) 2 When cordless handset cannot link to dummy base unit, check following RF check flowchart. 3 Put cordless handset on the right side of dummy base unit. 4 Confirm RSSI level on the dummy base unit by using oscilloscope. (Select "RSSI" mode on dummy base unit) RSSI Level: More than 1.5V
	Check point	1 Check Antenna and RF unit	1 Check Antenna and RF unit

		base unit	cordless handset
5 Rx Data & / RXDSG confirmation	Procedure	1 Set "Registration Mode". / (Normal operation mode, no Test Mode)" 2 Confirm "RXDSG (Pin9 of RF unit)" (Rx S/H control signal) waveform at RF terminal 3 Confirm "RXDA / RXDB" (Rx receiving Data) waveform at RF terminal *S/H : Sample and hold mode	1 Set "Registration Mode". / operation mode, no Test M 2 Confirm "RXDSG (Pin9 of (Rx S/H control signal) wa at RF terminal 3 Confirm "RXDA / RXDB" (receiving Data) waveform terminal *S/H : Sample and hold m
	Check point	(RXDSG) 1 Check R887 and IC818, C870. (RXDA/RXDB) 1 In the case that waveform is none, replace RF unit. 2 In the other case (waveform is abnormal), check R893 and R888.	(RXDSG) 1 Check R96 and IC1, C91. (RXDA/RXDB) 1 In the case that waveform replace RF unit. 2 In the other case, check R C62 and C65.
5 Rx Sensitivity / confirmation Refer to Radiation sensitivity check	Procedure	1 Set Test mode Link to base unit and dummy cordless handset. / (Fixed channel link / Dummy Power SW: Low) 2 When base unit cannot link to dummy cordless handset, check RF unit following RF check flowchart. 3 Put base unit on the right side of dummy cordless handset. 4 Confirm there is no noise in line output signal.	1 Set Test mode Link to cor handset and dummy base (Fixed channel link / Dumi SW: Low) 2 When cordless handset ci to dummy base unit, chec following RF check flowcl 3 Put cordless handset on t side of dummy base unit. 4 Confirm there is no noise output signal.
	Check point	1 Check Antenna and RF unit	1 Check Antenna and RF ur
6 RSSI adjustment Refer to The method to adjust RSSI A, B RSSI A RSSI B	Procedure	1 Set Test mode Link to base unit and dummy cordless handset. / (Fixed channel link / Dummy Power SW: Super Low Power) 2 When base unit cannot link to dummy cordless handset, check RF unit following RF check flowchart. 3 Put base unit about 2m away from dummy cordless handset. 4 "Select RSSI A" store mode. 5 Change Dummy power SW to "Low Power".	1 Set Test mode Link to cor handset and dummy base (Fixed channel link / Dumi SW: Super Low Power) 2 When cordless handset ci to dummy base unit, chec following RF check flowcl 3 Put cordless handset on t side of base unit. 4 "Select RSSI A" store mo 5 Change Dummy power SV Power".

		base unit	cordless handset
		6 "Select RSSI B" store mode. * Refer to in Check about RF characteristics in detail.	6 "Select RSSI B" store mode. * Refer to in Check about RF characteristics in detail.
	Check point	1 Check Antenna and RF unit	1 Check Antenna and RF unit

12. REPLACEMENT OF RF UNIT

12.1. Procedure to remove RF unit

Solder iron jig for replacement of RF unit consists of solder iron, heater, magnet, pin, temperature control box, PCB fixture and fence for safety.
This jig can be used for both base unit and cordless handset by exchanging fixture.
In case of base unit, push C860 toward the edge of circuit board before removing RF unit.
There are two types of desoldering jig as shown below.

12.1.1. Type 1

1. Connect AC power. (This jig needs two AC power.) Then set heater SW to ON.
2. Set fixture for base unit or cordless handset to jig. → See "[Picture 2](#)".
3. Set solder iron temperature to 270°C. → See "[Picture 3](#)".
 - 3-1. Push "Mode button". → "SV" mark on display is ON. This mark means temperature adjustment mode.
 - 3-2. Set solder iron temperature to 260 - 270°C by pushing up & down button.
 - 3-3. Again push "Mode button". Then confirm that "SV" mark on display is OFF.
 - 3-4. Check that mark of "Heater ON/OFF" is on.
4. It will take about 30 minutes to make solder iron warm.
5. After solder iron warms, set circuit board on fixture.
6. Press solder iron on circuit board by pressing down lever.
7. Keep on pressing down for about 40 seconds.
8. Return lever to original position. → Simultaneously RF unit is lifted.
9. Remove circuit board that RF unit was removed.

10. Move a kind of plate under solder iron.

11. Remove RF unit that was lifted by magnet by pushing bar. → See "[Picture 6](#) and [Picture 7](#)".

*Pay attention not to touch RF unit directly because RF unit is hot.

12. Remove solder on the pad of removed RF unit.

13. Put new RF unit on circuit board, then solder.

Picture 1

Picture 2

Picture 3

Temperature control box

Picture 4

Picture 5

Picture 6

Picture 7

12.1.2. Type 2

12.1.2.1. Structure

1. Main

This jig consists of lever, solder iron, fence and temperature controller.

2. Fixture

Fixture to fix PC board on jig. For base unit, for cordless handset.

3. Temperature Controller

Controller to keep proper temperature.

12.1.2.2. Power ON & Set Temperature

- 1. Power SW on.**
- 2. Set temperature to 270 degree(C) by pressing up and down key.
Red number shows target temperature.
Green number shows actual temperature.**
- 3. After setting temperature, press “ENT” key.**
- 4. It takes 30 minutes to reach proper temperature.**

12.1.2.3. Set Fixture on Desoldering Jig

1. Set each fixture on the stand.

(Stand)

(For cordless handset) / Fixture for cordless handset is set on stand.

(For base unit) / Fixture for base unit is set on stand.

12.1.2.4. Set PC Board on Fixture

1. Set PC board on fixture.

In case of base unit PC board, bend C860 toward edge of PC board.

12.1.2.5. Pull Down Lever

1. Check if actual temperature on controller equals to target temperature.
2. While pulling down lever, adjust position of solder iron so that fit to RF unit position.
3. Keep pulling down lever firmly for 40 seconds.

12.1.2.6. Pull Up Lever

1. After 40 seconds, pull up lever.

Solder iron catches removed RF unit by magnet inside of solder iron.

12.1.2.7. Remove PC Board and Fixture

Remove PC board and fixture from the stand of jig.

12.1.2.8. Push Lever to Remove RF Unit

1. Push lever to the direction of picture to remove RF unit caught by magnet.

2. Because the dropped RF unit is very hot, pay attention to touch.

12.1.2.9. Remove Unnecessary Solder on PC Board

1. Remove unnecessary solder on PC board by solder wick.

12.1.3. How to Solder the RF Unit (Base Unit)

There are 3 types of RF unit in the base unit produced in factory.

1. No spacer on the bottom of RF unit
2. A spacer is equipped on the bottom of RF unit. (Fig. 1)
3. 4 metal plates are equipped on the bottom of RF unit. (Fig. 2)

Every RF unit of above-mentioned type should be replaced with the one of part No. PQWPTG2000I (equipped with a spacer).

In case of 3., install a new RF unit after removing 4 metal plates.

Soldering should be followed the conditions below.

Soldering iron	HAKKO 907 24V 50W or the equivalent
Adjustment temperature	480°C (Adjustment dial is set to the maximum position.)
Temperature of the Copper Rod	430~440°C (Measured value)
Working Time	4 sec. a terminal (Enough time is required to melt the solder.)

Be careful of the short or defect when soldering.

12.1.4. Solder

1. Put new RF unit on PC board.

RF unit for only base unit has sheet under RF unit to keep space between RF unit and PC board.

PC board of cordless handset bends a little at production process in factory. So no need to put metal plate or sheet to keep space between RF unit and PC board.

Thin sheet is stucked under RF unit to keep a space between RF unit and PC board.

2. First solder 4 corners of RF unit while pressing RF unit.

(Bad solder)

(Good solder)

Solder all solder pads. / After replacing RF unit, RSSI should be adjusted by using dummy jig.

13. CABINET AND ELECTRICAL PARTS (Base Unit)

14. CABINET AND ELECTRICAL PARTS (Cordless Handset)

14.1. CABINET AND ELECTRICAL PARTS (Charger)

16. REPLACEMENT PARTS LIST

This replacement parts list are KX-TG2000CB only.

Note:

1. RTL (Retention Time Limited)

The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability is dependent on the type of assembly, and in accordance with the laws governing part and product retention.

After the end of this period, the assembly will no longer be available.

2. Important safety notice

Components identified by a  mark special characteristics important for safety. When replacing any of these components, use only manufacture's specified parts.

3. The S mark indicates service standard parts and may differ from production parts.

4. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (Ω) K=1000 Ω , M=1000k Ω

All capacitors are in MICRO FARADS (μ F) P= μ μ F

***Type & Wattage of Resistor**
